Quantum computer: the space race of the century

Scientific, Economical & Political

Publications, patents, national investment plans, press, lobbying...

Quantum Technologies will be a must-have for strategic fields

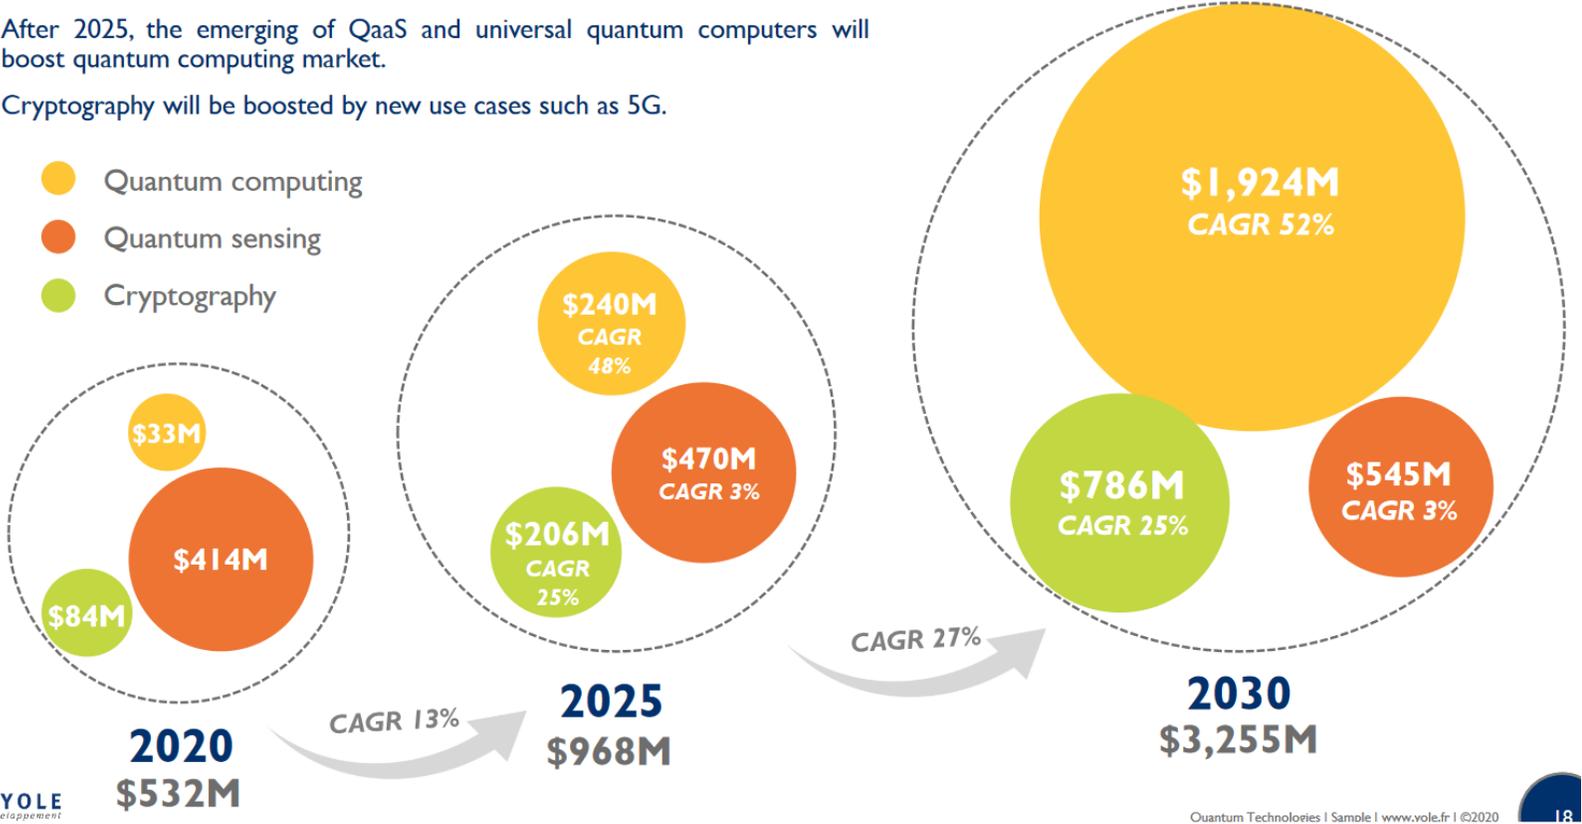

Not only computing

2020 – 2025 – 2030 QUANTUM TECHNOLOGIES FORECAST

After 2025, the emerging of QaaS and universal quantum computers will boost quantum computing market.

Cryptography will be boosted by new use cases such as 5G.

- Quantum computing
- Quantum sensing
- Cryptography

Photonics is at the heart of this Revolution

Flying Qbits
(communications)
- Quantum Internet

Manipulation of Qubits
at room temperature
and no vacuum.
Modular design

Protocol flexibility.
Generation of cluster states for universal Q
computing

Long coherence time
Support high clock rates

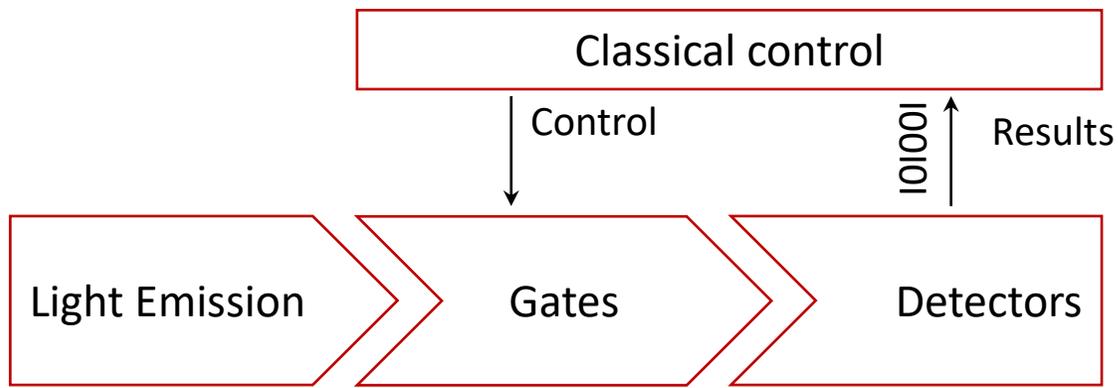

Outline:

- Single-photon sources for quantum computing
- Quandela's approach
- Implementation and challenges

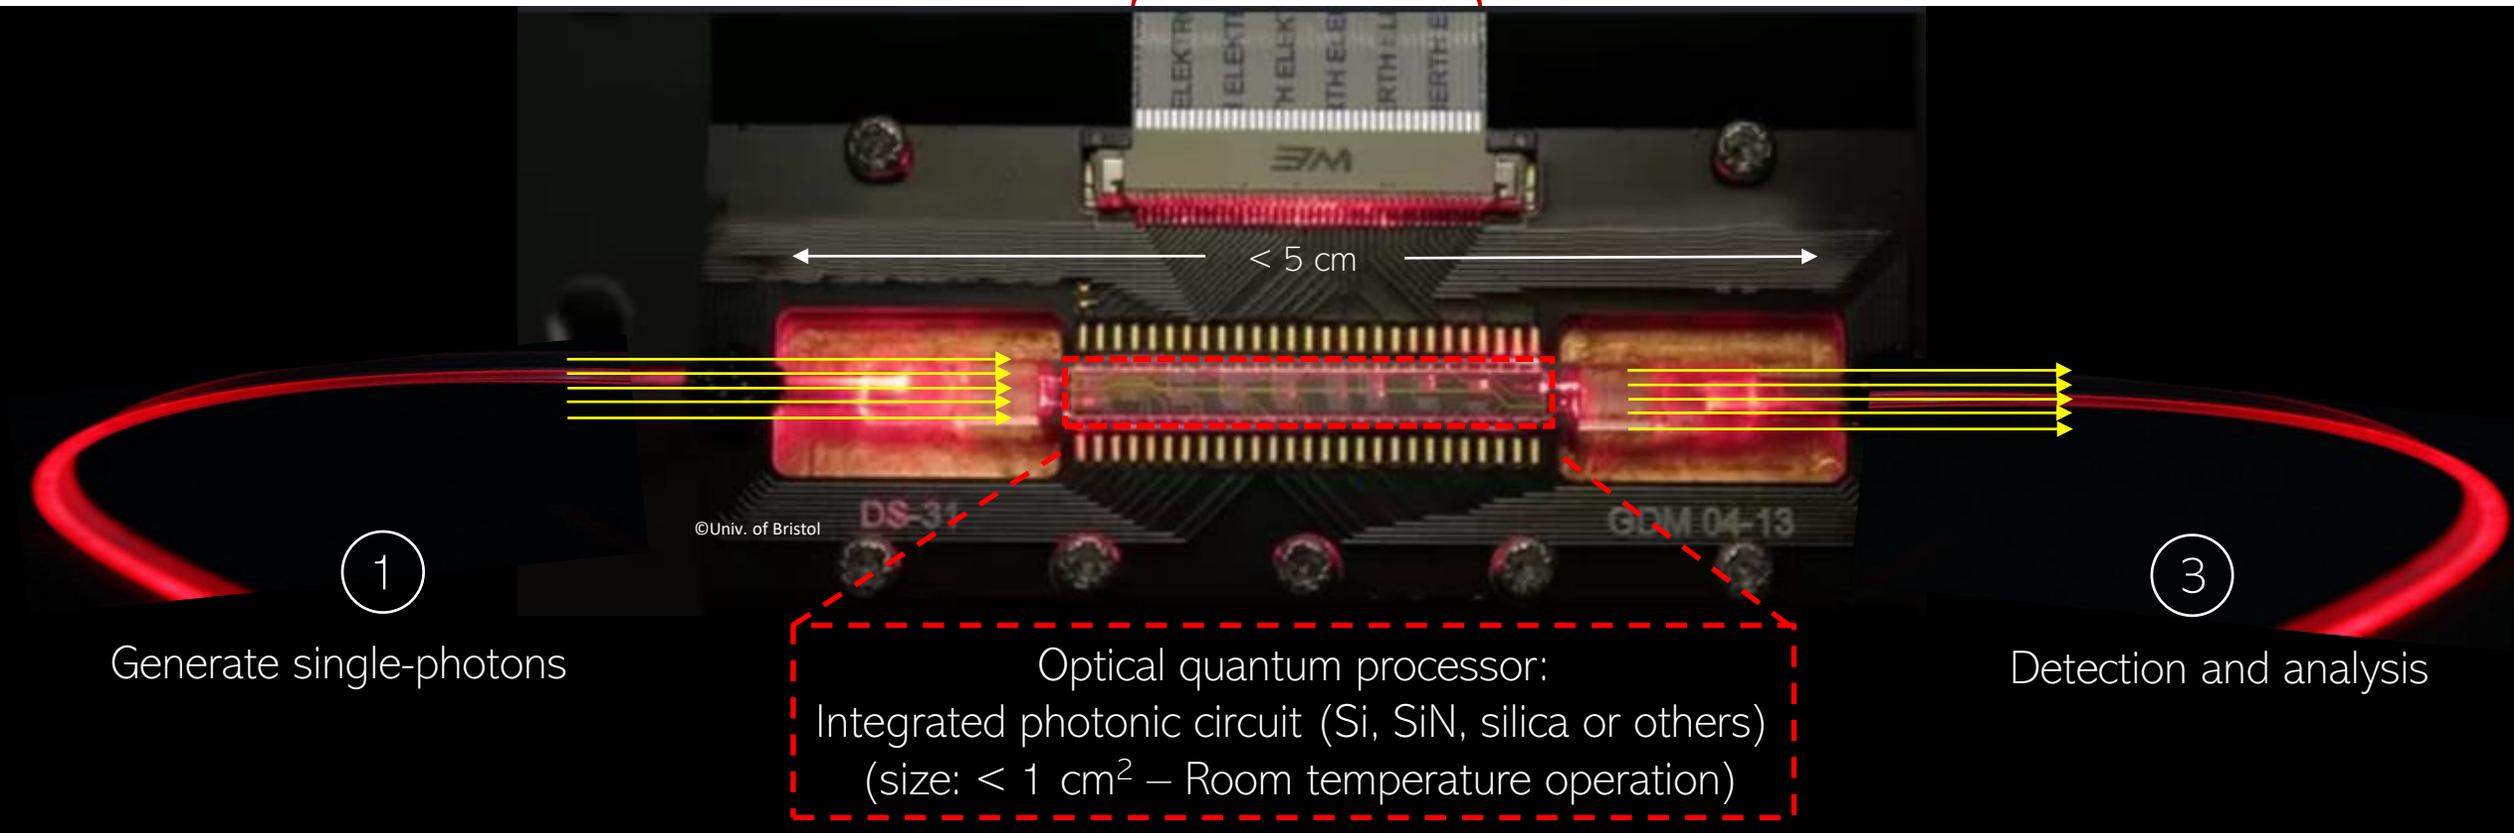

Optical quantum computing

Sequence of linear optical elements to manipulate a large number of single-photons

②

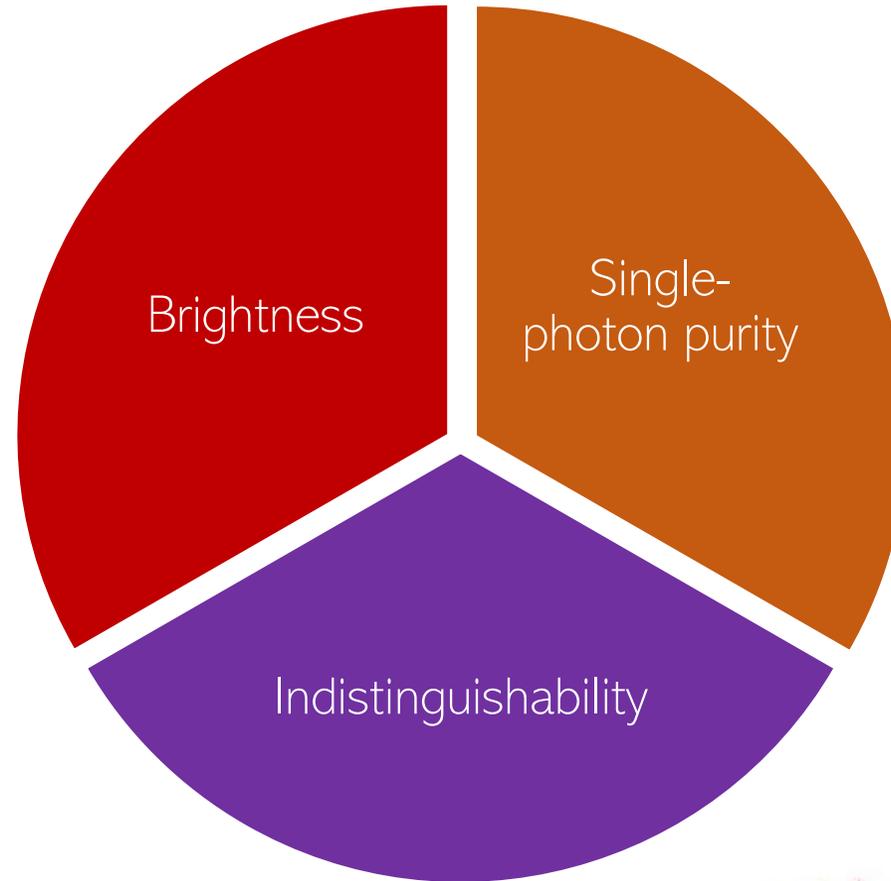

Logic gates controlled by a classical PC

Single-photon source performance – figure of merit

Probability of collecting a photon / input laser pulse

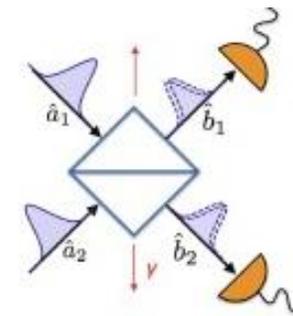

Computation speed - complexity

Probability of having only ONE photon / optical mode

Fidelity of logic gates (errors)

Probability that all photons are identical in every degree of freedom (required for photon interference) - Hong-Ou-Mandel -

B

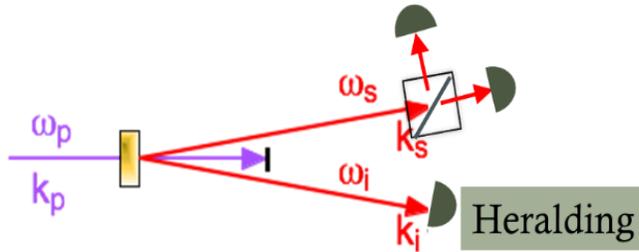

$$P(0,2) = \left| \frac{\sqrt{T}}{i\sqrt{R}} \right|^2$$

$$P(2,0) = \left| \frac{i\sqrt{R}}{\sqrt{T}} \right|^2$$

Efficient emission of Quantum Light is a challenge itself

Laser based – approximated sources

- Attenuated lasers: single-photons
- Lasers + non-linear medium (SPDC – four-wave mixing): indistinguishable and entangled photons

Probabilistic – emission based on Poissonian stats.
require heralding (additional components)

$$|\psi\rangle = \sqrt{1 - |\lambda|^2} \sum_n \lambda^n |n_s, n_i\rangle$$

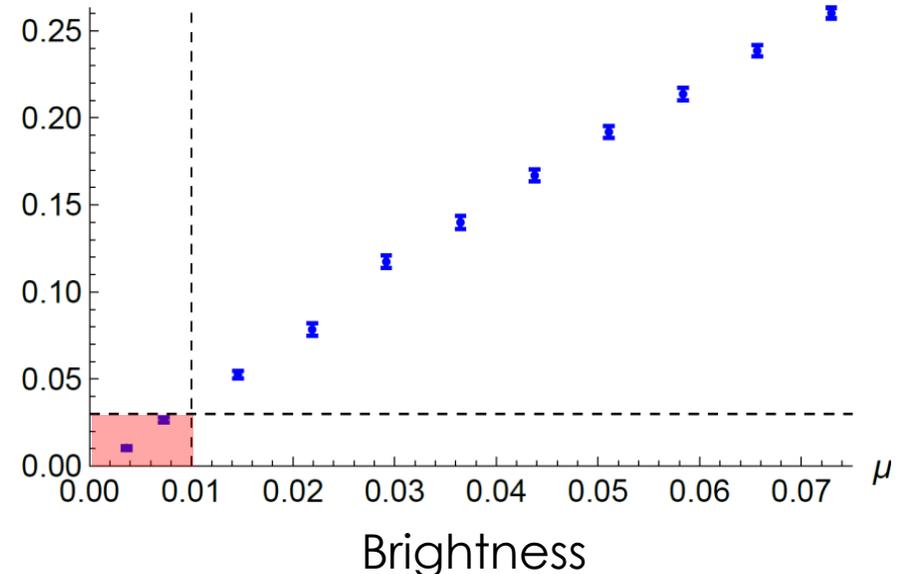

Brightness proportional to multi-photon emission

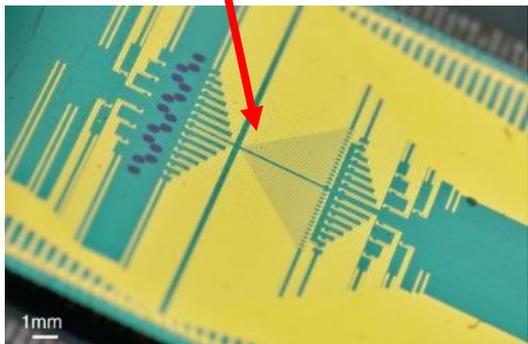

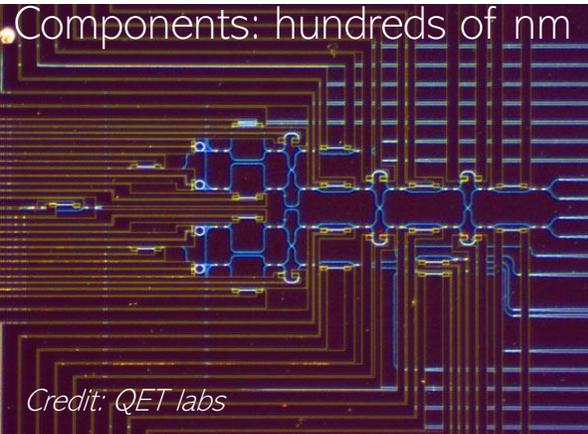

$$(|\lambda| \ll 1) \quad |\psi\rangle \approx \frac{\lambda}{|\lambda|} |1_s\rangle + \frac{\lambda^2}{|\lambda|^2} |2_s\rangle \quad B = |\lambda|^2$$

$$g^{(2)}(0) \approx \frac{2P_s(2)}{P_s(1)^2} = 2|\lambda|^2 \ll 1 \text{ if } B = |\lambda|^2 \ll 1$$

Intrinsically limited – brightness Vs SP purity

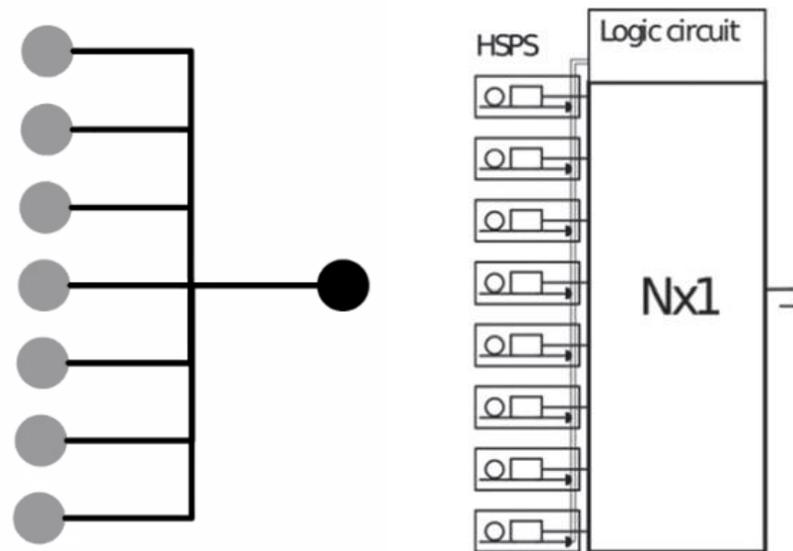

Multi-photon prob.

Multiplexing and adaptivity:

“Repeat operations (emission) many times and use classical logic to select successful operations”

Many inefficient heralded sources + switches, delay lines, more detector & electronics

Increasing amount of resources, architecture complexity, PIC space

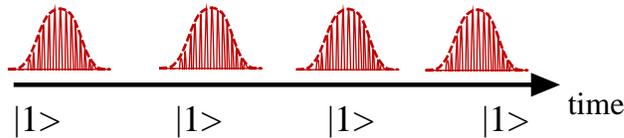

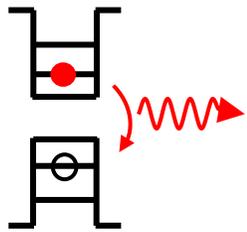

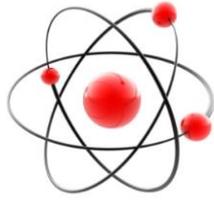

Base concept in the QC architecture of PsiQuantum

Gimeno-Segovia – phd thesis: Towards practical linear optical quantum computing

Efficient emission of Quantum Light is a challenge itself

Single-emitters

- Natural atoms
- Artificial atoms

Deterministic / push-button emission

Brightness with no multiphoton emission

$$|\psi\rangle \approx \sqrt{p_0}|0\rangle + \sqrt{p_1}|1\rangle + \sqrt{p_2}|2\rangle, \quad (p_0 + p_1 + p_2 = 1)$$

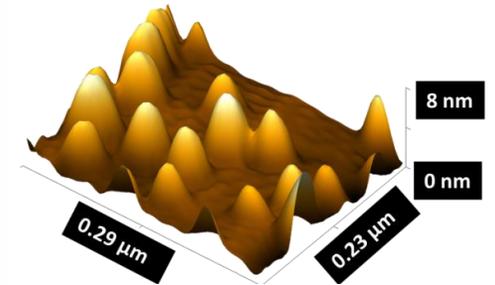

$$B \rightarrow 1 \quad \& \quad g^{(2)}(0) = \frac{\sum n(n-1)p_n}{[\sum np_n]^2} \rightarrow 0$$

High brightness & high SP purity + indistinguishab.

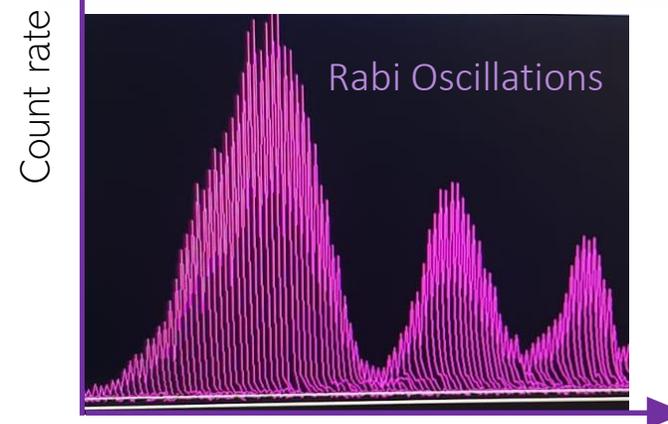

Semiconductor quantum dots = artificial atoms

Coherent control

Compatible with III-V semiconductor's industry

Pulse area

White paper can be found at: <http://quandela.com/edelight-3>

All the photons
are then emitted
in the same
direction, in a
gaussian mode.

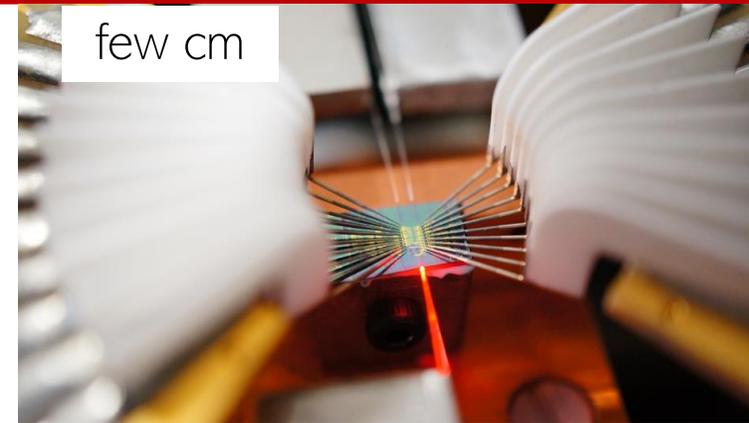

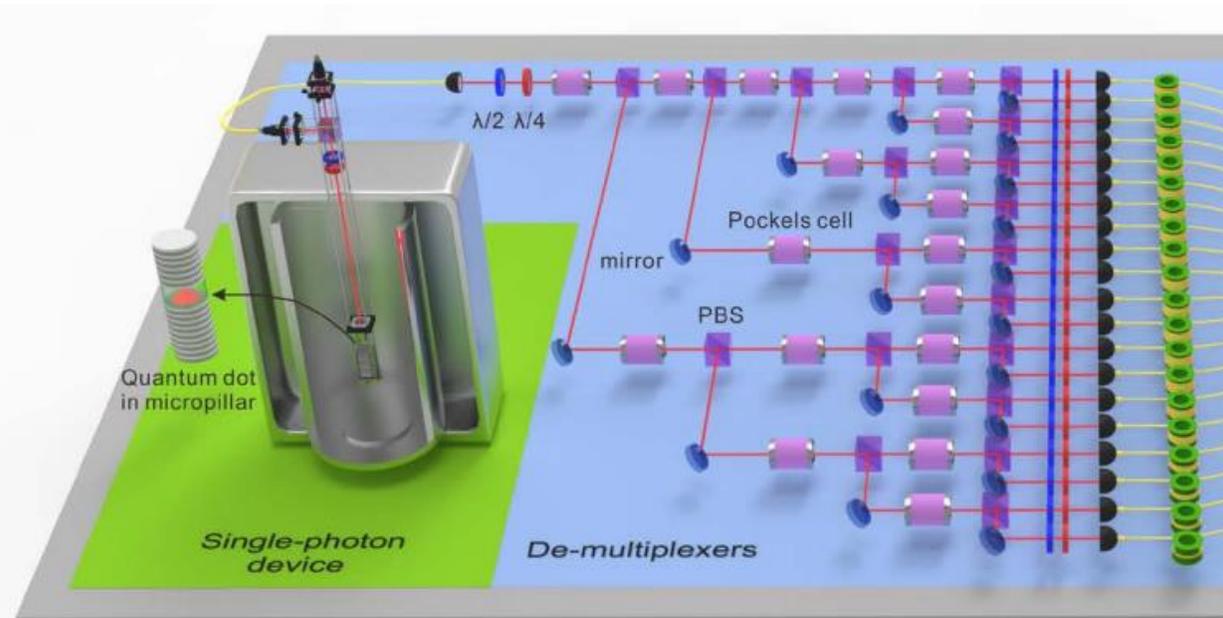

High coupling
into a single
mode fiber

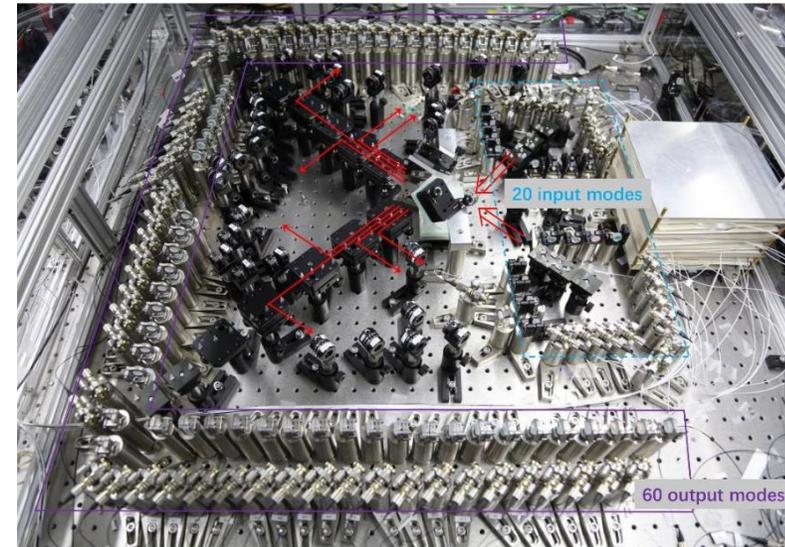

De-multiplexing :

1 highly efficient SP source + routing of temporally separated photons in different spatial modes

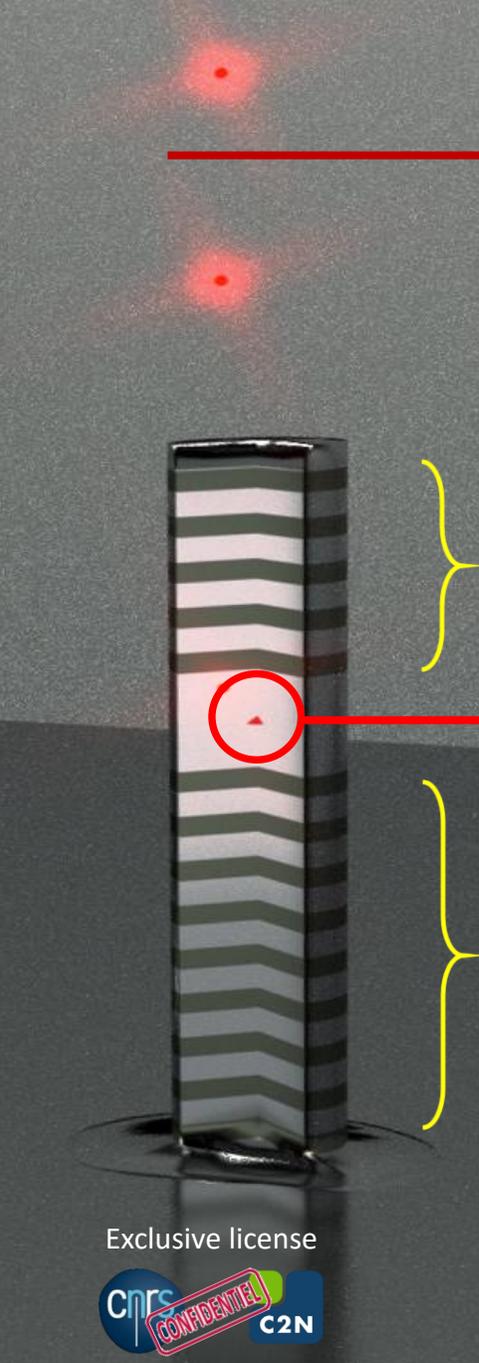

State-of-the-art multi-photon experiment - 20

Control of the photon emission: technological challenge

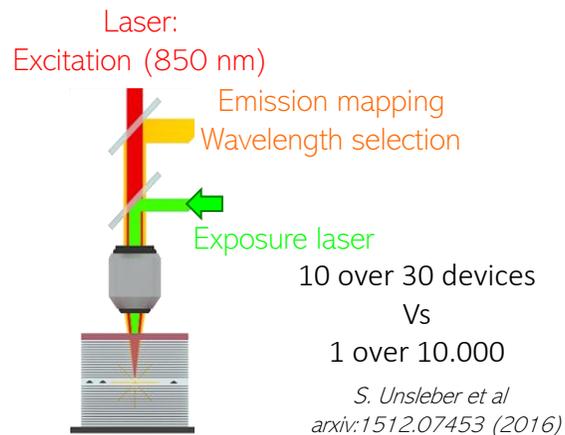

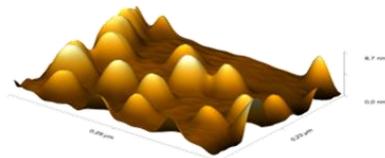

Top Cavity Mirror

Semiconductor Quantum Dot

Bottom Cavity Mirror

Mode coupling

Randomness

In-situ lithography

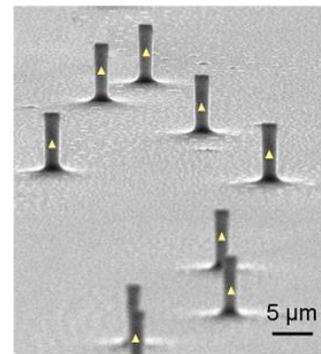

QD – optical mode coupling

$$\beta = 96\%$$

Dousse et al, PRL (2008)

Out-coupling

Losses

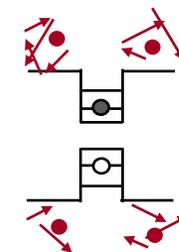

Processing optimization

80 % extraction efficiency

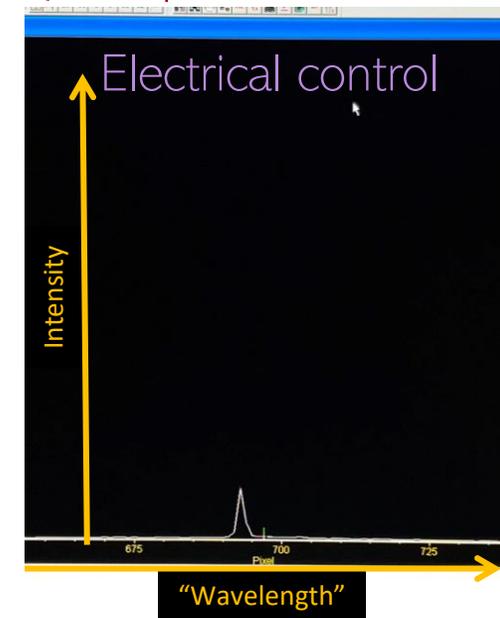

Phys. Rev. Lett. 2012

O. Gazzano et al. Nat. Commun. (2013).

Coherence

Spin & Charge
Noise +
Phonons

Near-zero dephasing
High indistinguishability

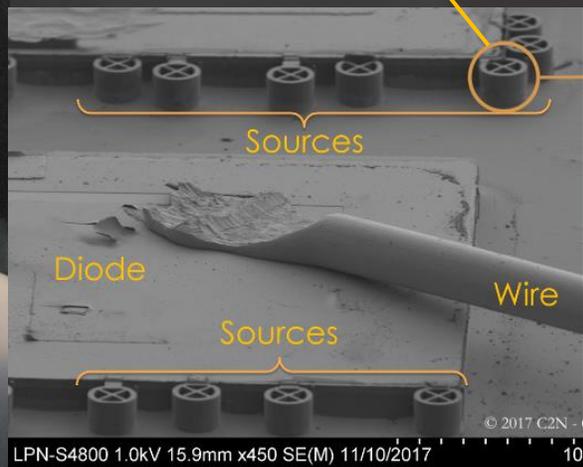

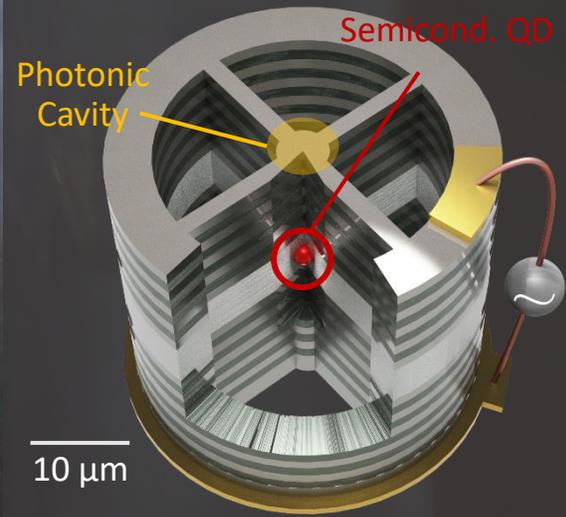

Nowak et.al. Nat. Commun. (2014)

Somaschi et. Al. Nat. Photon. (2016)

Exclusive license

Micron size integrated source

eDelight

Key Features:

Multi-photon prob.
< 2 %

Indistinguishability
HOM
> 95 %

Brightness
> 20 % (several MHz)

eDelight

Key Features:

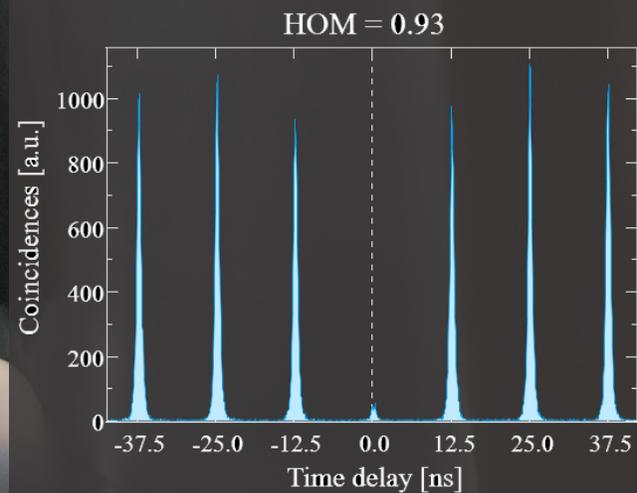

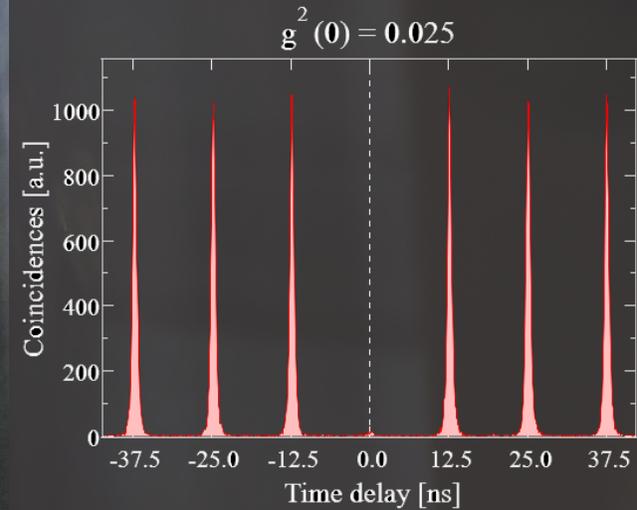

SP purity
> 97 %

Indistinguishability
HOM
> 92 %

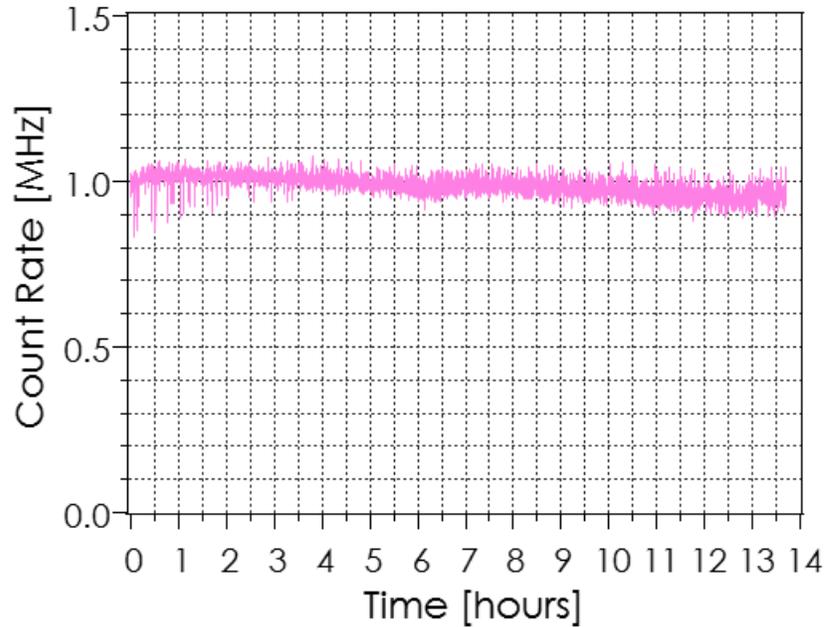

Brightness
> 10 % (several MHz)

	State-of-the-art laser source (Optica Vol.5, issue 5, p. 514-517 – 2018) HOM = 90%	Quandela HOM > 92%	Speed-up
Rate: 1 photon - qubit	1.3 MHz	> 25 MHz	x 20
Rate: 3 photons - qubits	55 Hz	9 kHz	X 160
Rate: 8 photons - qubits	10^{-8} Hz	0.5 mHz	X 50000

Compact implementation & efficiency

SP emission stability over several hours

Open facility:

- fully fibered
- full assistance
- possibility for remote experiments

Visit: <http://quandela.com/quandelab> for more information

FIBERED OUTPUT. SINGLE-PHOTON COUNT RATE:

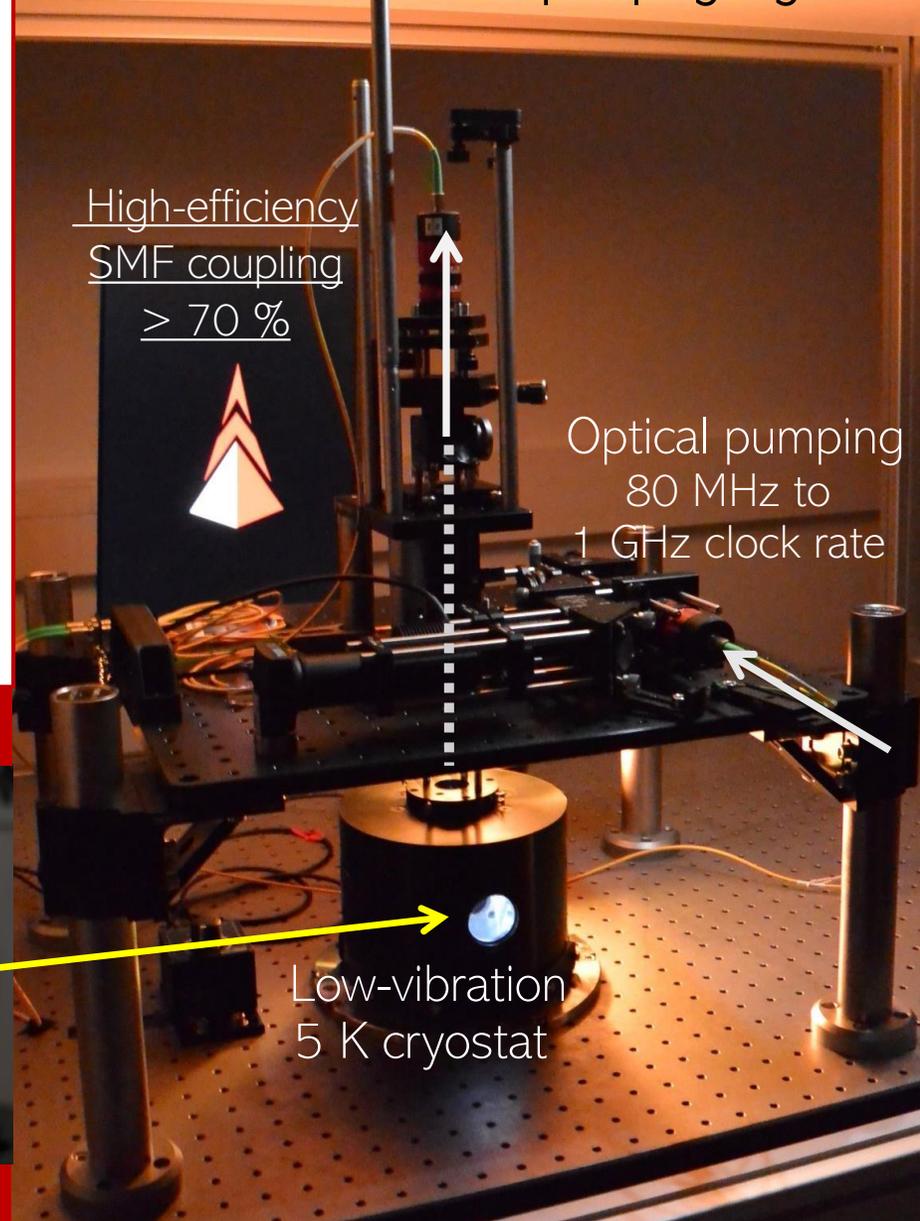

- > 6 MHz at the output fiber @ 80 MHz clock rate
- > 80 MHz at the output fiber @ 1 GHz clock rate

Efficiency > 10% (20%)

source device

Resonant fluorescence pumping regime

High-efficiency
SMF coupling
> 70 %

Optical pumping
80 MHz to
1 GHz clock rate

Low-vibration
5 K cryostat

Multi-photons interference on chip

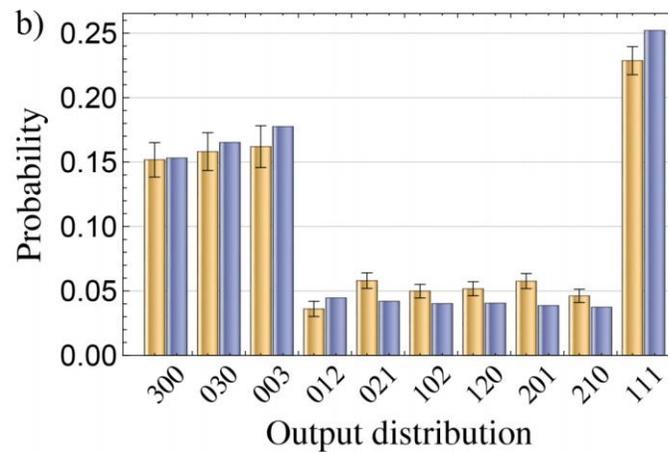

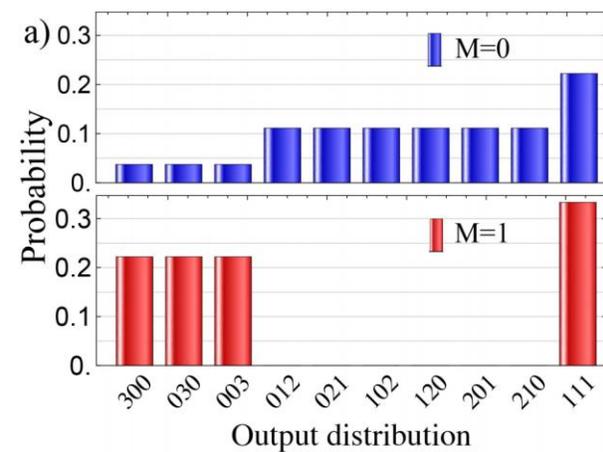

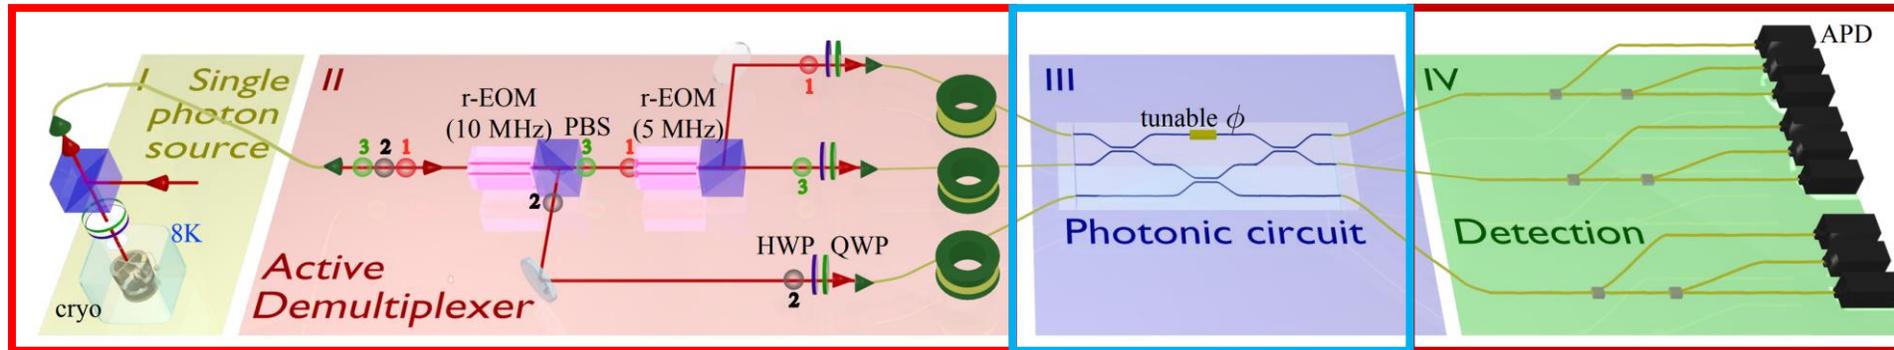

Collaboration:

Prof. P. Senellart – Quandela - Prof. R. Osellame – Prof F. Sciarrino

SAPIENZA
UNIVERSITÀ DI ROMA

C Anton et al., vol. 6, 1471, Optica (2019)

3 phot. rate
SPDC 43 Hz
eDelight 3.8 kHz
x 88 brighter

Loss balance + way for improvement

- chip transmission + fiber-array coupling per photon (17% → 60%)
- SP detectors (30% → 90%)
- Brightness and demux transmission (7% & 65% → 50% & 80%)
- Gen. 3-photon rate after chip (19 Hz → 5 MHz)

1. PERFORMANCE

Increase brightness

Indistinguishability → 99%

Entangled-photons generation

2. USABILITY

Towards stand-alone system and
plug-and-play

3. REPRODUCIBILITY + SCALABILITY

Photon interference from separated devices

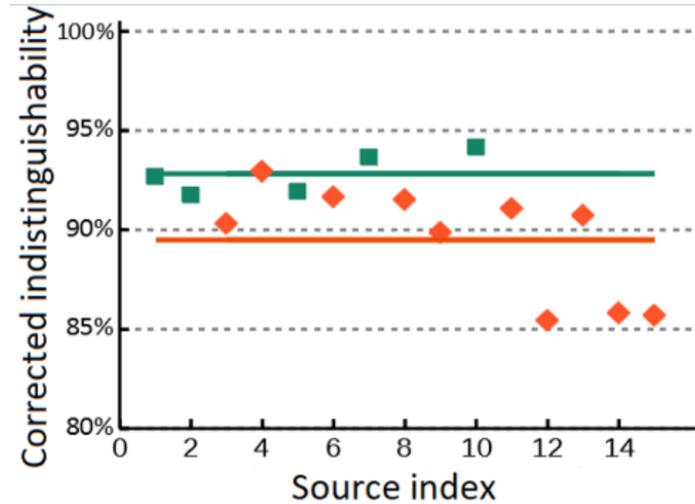

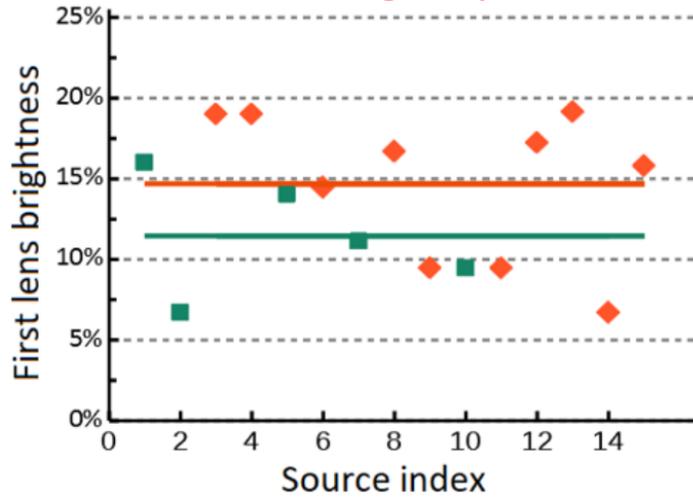

Fabrication of several identical devices

Identical emission wavelength + identical SP temporal profile

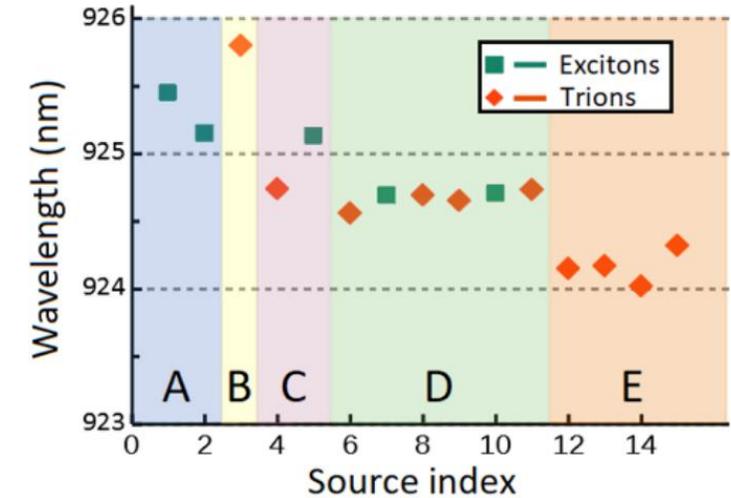

Reproducibility and scalability – towards identical sources

Statistic on 15 sources over 5 different chips

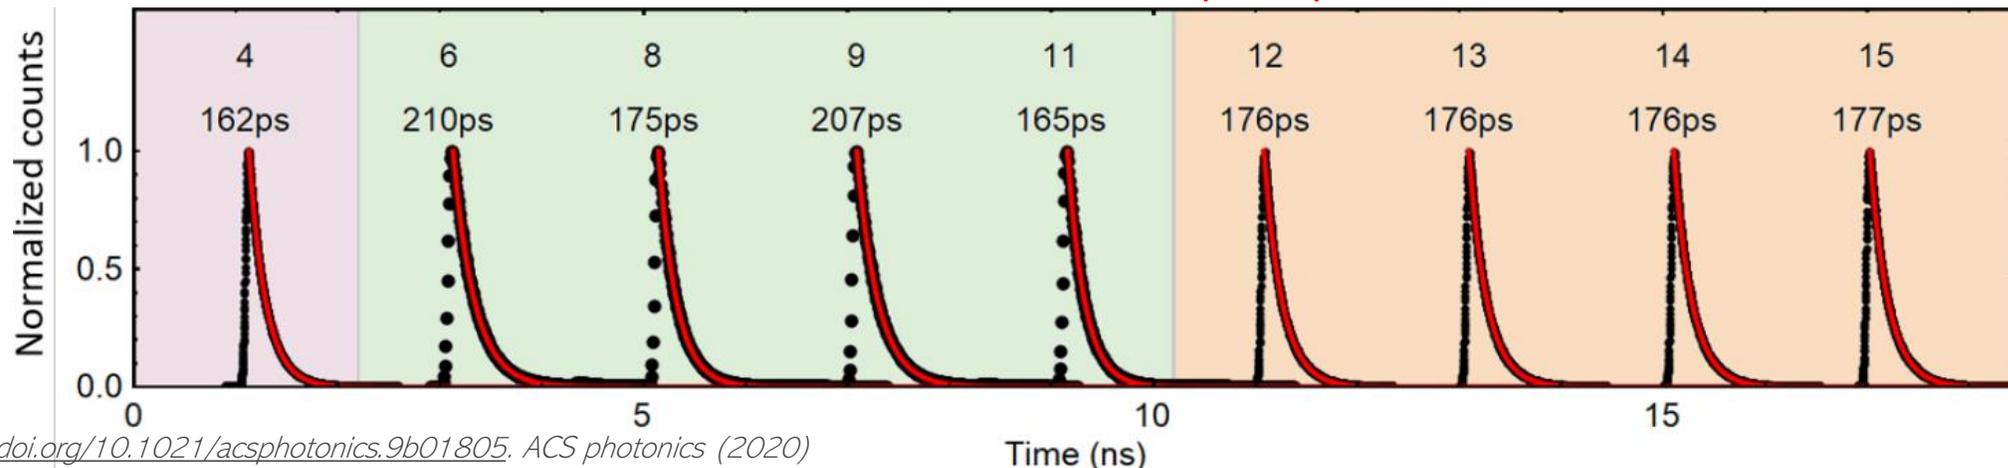

high reproducibility of top-performances

homogeneous emission wavelength

uniform distribution of temporal profiles

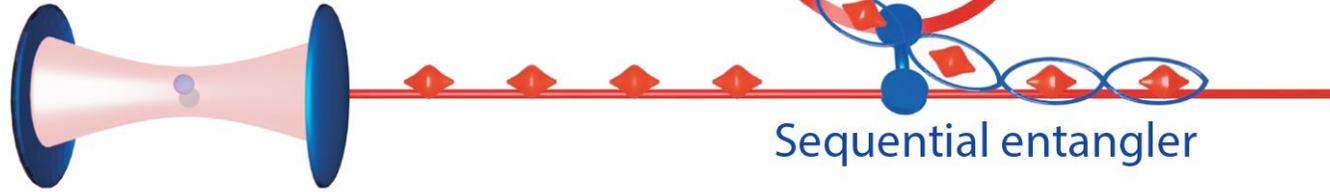

Collaboration:

Single-photon source

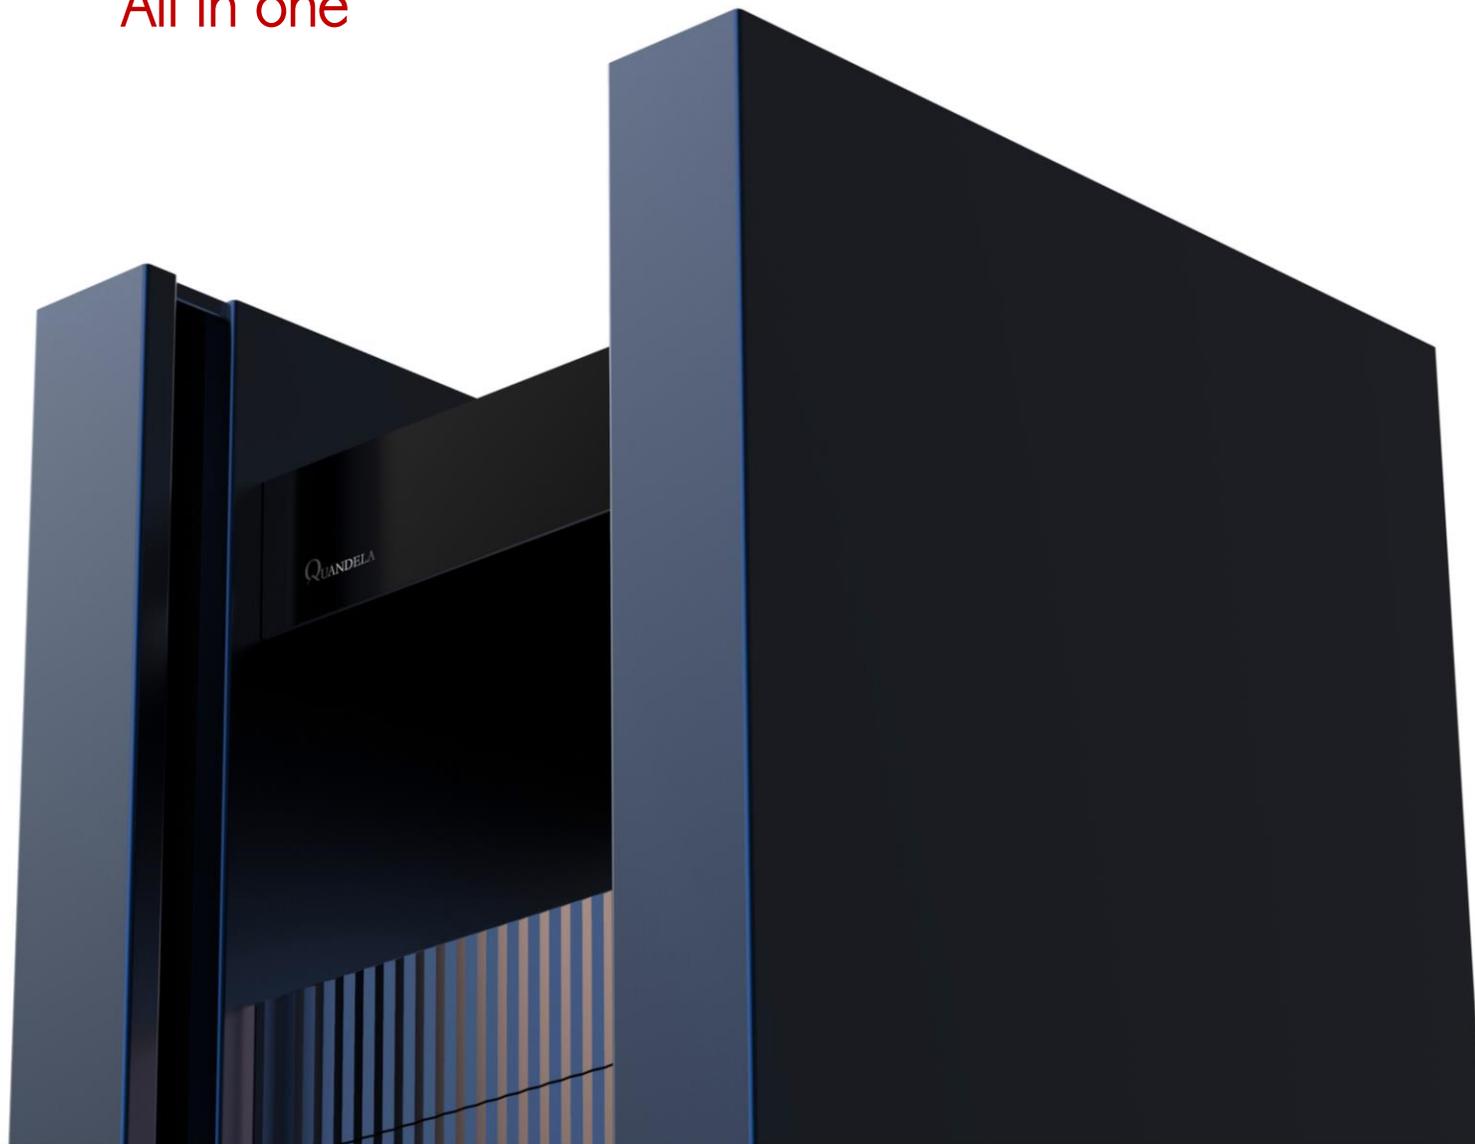

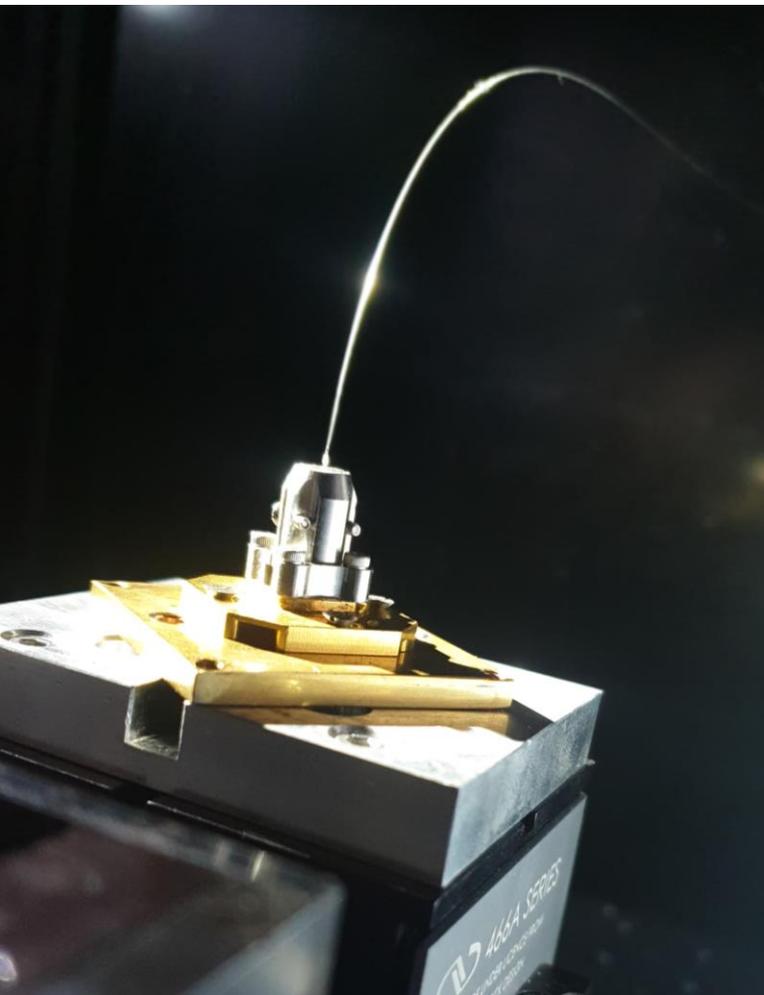

Entangled photons cluster state generation

D. Istrati et al. arxiv:1912.04375 (2020)

Next generation of Plug & Play SPS system (available soon)

All in one

Next generation of Plug & Play SPS system (available soon)

Thank you
