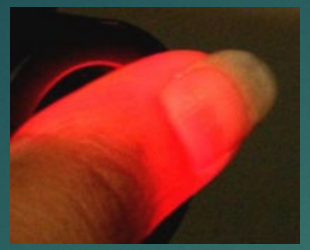
Outline

- Motivation
- Tissue ‘optical windows’
- Fundamentals of tissue optical clearing (OC) and optical clearing agents (OCAs)
- Quantification of optical properties
- Collimated transmittance, free and bound water
- OC of pathological tissues
- Creation of UV window
- Confocal Raman spectroscopy of skin
- Nonlinear optical imaging
- Optical coherence tomography (OCT)
- Photoacoustic microscopy and flow cytometry
- Speckle dynamic microscopy
- MRI agents
- Enhanced FLIM
- Luminescence: upconversion nanoparticles
- Tissue phantoms for OC
- OCAs for THz waves
- Summary
- OC multimodality concept
- Conclusion

Motivation: Challenges of Optical Imaging



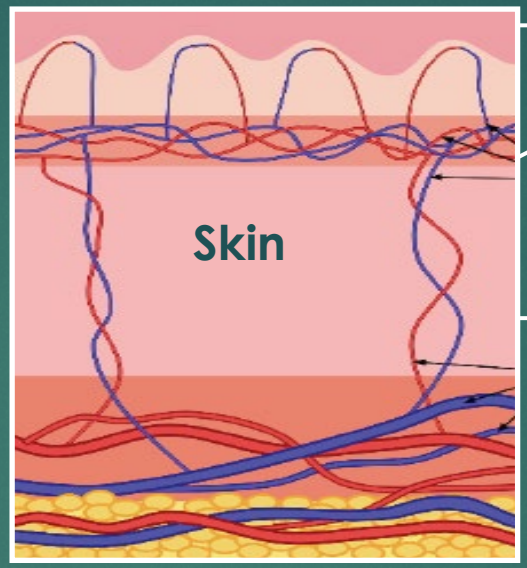
Soft limit ~ δ

1 – 2 mm

$$\delta = 1/\sqrt{3\mu_a\left(\mu_a + \mu_s'\right)}$$

Hard limit ~10 δ

$$\mathrm{MFP} = l_{ph} = 1/(\mu_a + \mu_s)^{-1}$$



OM, SNOM

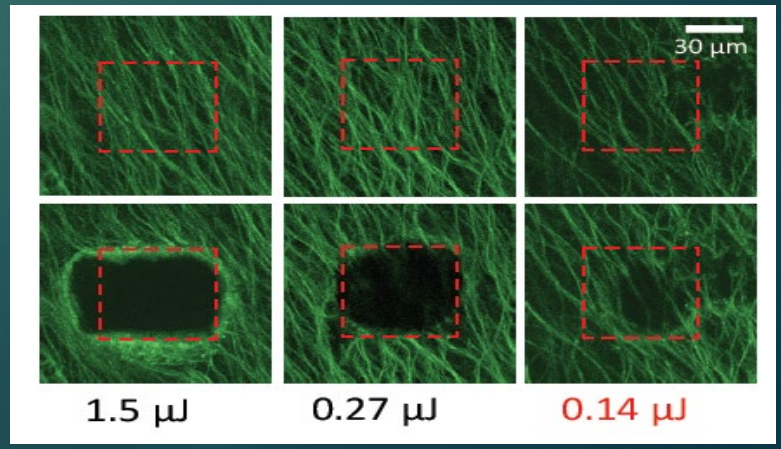
CFM, 2PM, SHM, etc.

OCT

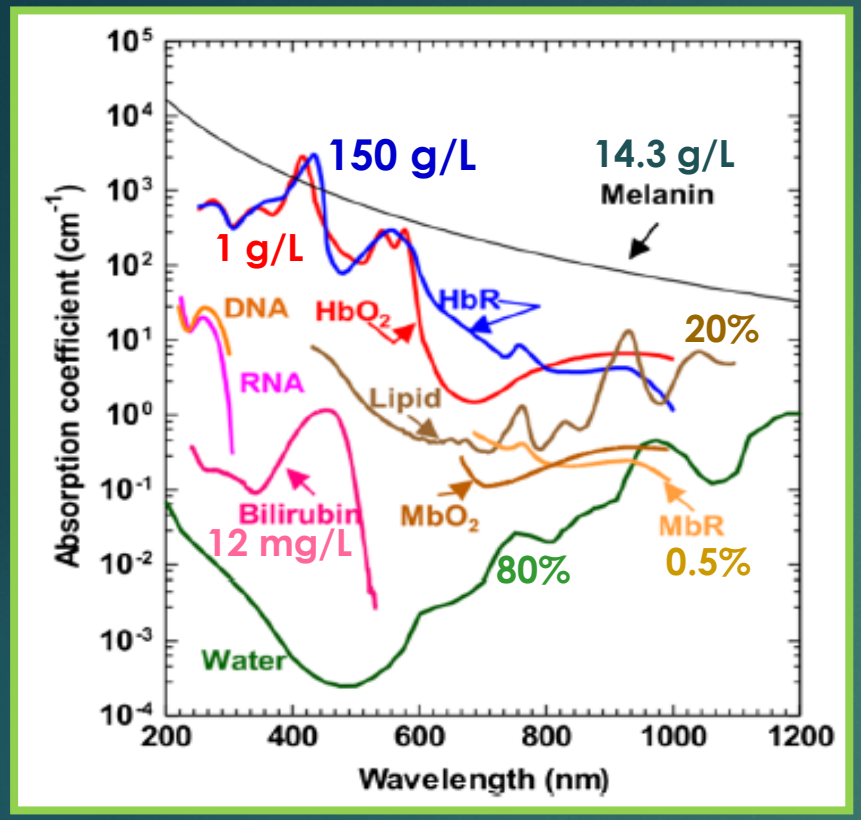
DOT,
UOT, PAT

OM: Optical microscopy
SNOM: Scanning near-field optical microscopy
CFM: Confocal microscopy
2PM: Two-photon microscopy
SHM: Second harmonic microscopy
OCT: Optical coherence tomography
DOT: Diffuse optical tomography
UOT: Ultrasound-modulated optical tomography
PAT: Photoacoustic tomography

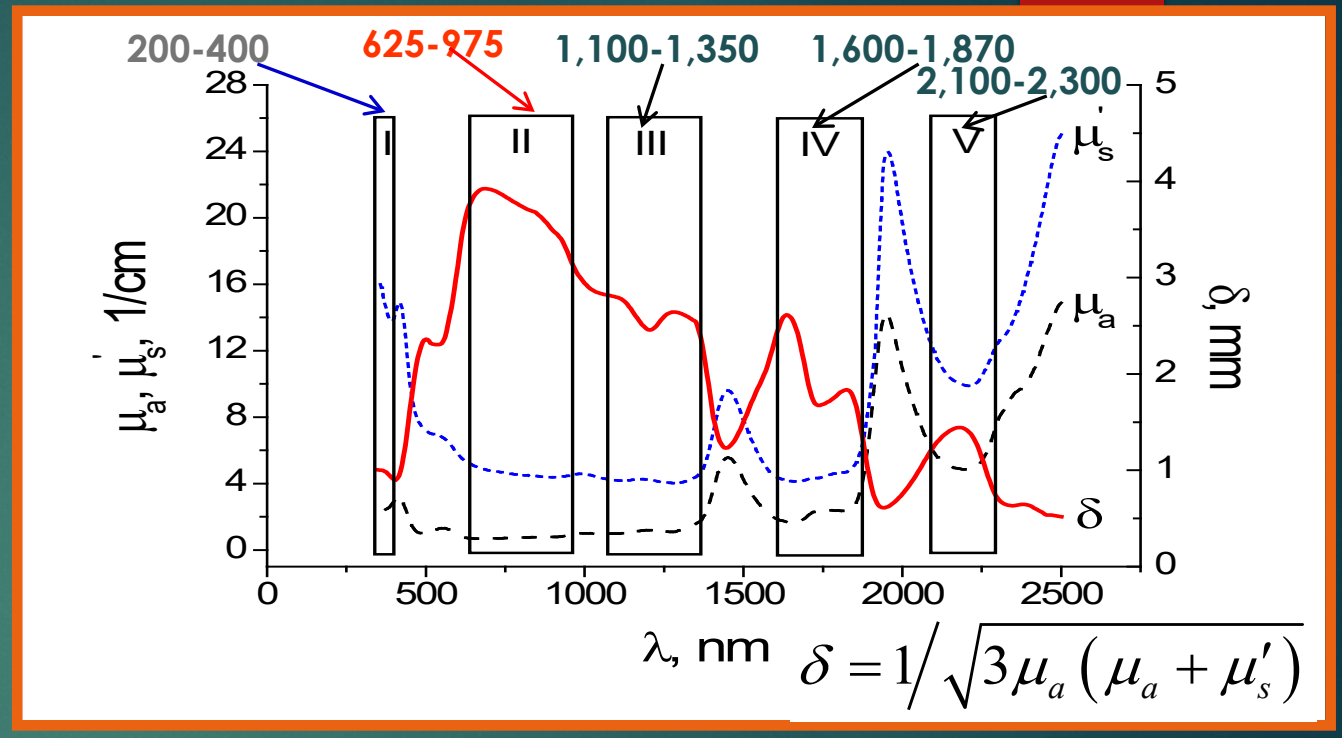
Laser Treatment



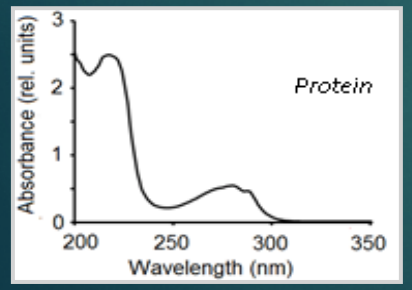
Tissue ‘optical windows’

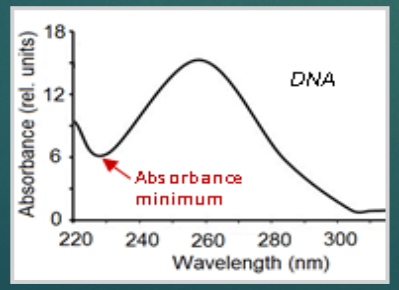


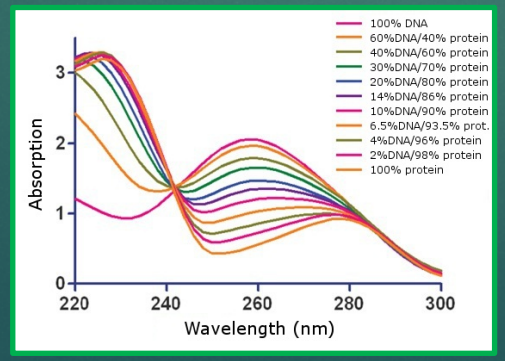
Y. Zhou, et al. J. Biomed. Opt. 21(6), 061007 (2016)



Absorption (μ_a) and reduced scattering (μ_s') coefficients, and light penetration depth (δ) of peritoneum within tissue ‘optical windows’
Bashkatov A. N. *et al* . *Opt. Spectrosc.* **120 (1)**, 1-8, 2016







Rat muscle treatment with 20% glucose solution

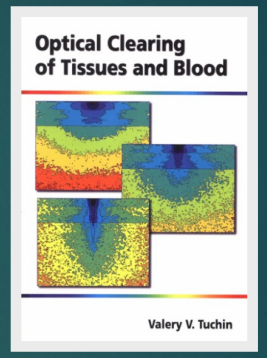
Brief history of tissue optical clearing (OC)

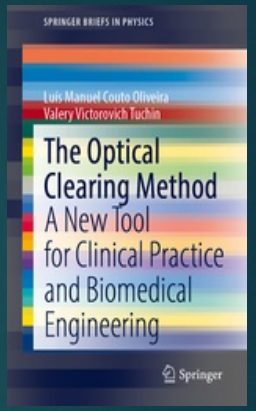
https://www.flickr.com/photos/baggis/3084210290

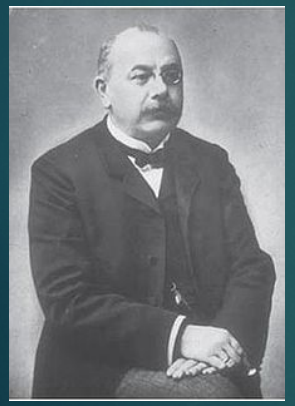
https://fr.wikipedia.org/wiki/Tipi#/media/File:Fredenbaum-100719-15599-.jpg

The optical clearing (OC) technique has been intuitively used by mankind since ancient times

Northern ancient European inhabitants used dried animal skin to construct the walls of their dwellings or dehydrated seal intestines for windows, so that light could enter inside







https://en.wikipedia.org/wiki/Werner_Spalteholz

Early OC offers for medical purposes are also known, but the major evidence of this technique has been discovered more than 100 years by the German anatomist Werner Spalteholz (*Spalteholz*, 1911, 1914)

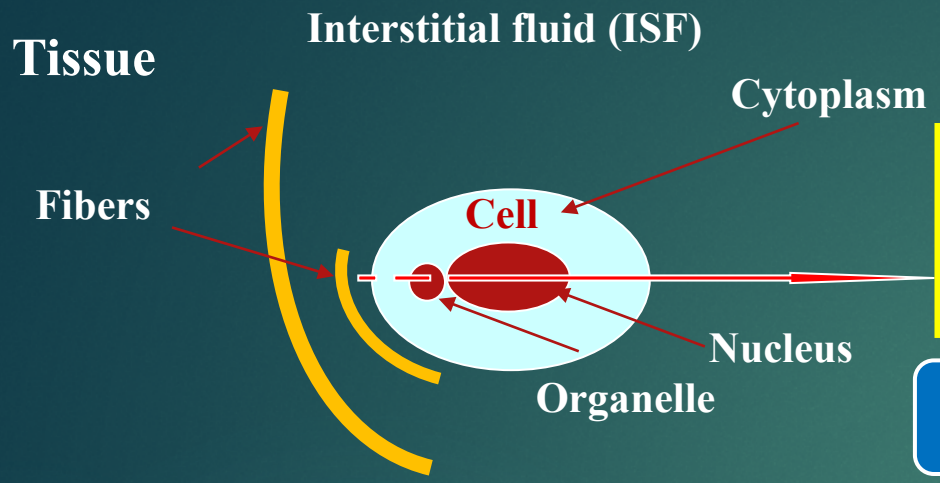
He realized that muscle tissue becomes transparent when dehydrated with the use of alcohol followed by clove oil or xylene and then stored in Canadian balsam (*Richardson et al.*, 2015; *Azwendt et al.*, 2016; *Azaripour et al.*, 2016)

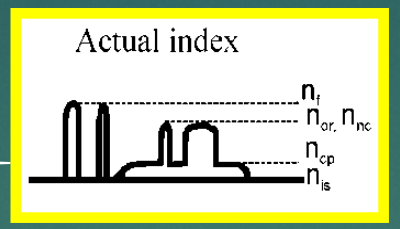
He immediately comprehended the occurrence of the RI matching mechanism, and the evidence of tissue shrinkage due to initial dehydration mechanism has been reported in 1939 (*Cumley et al.*, 1939)

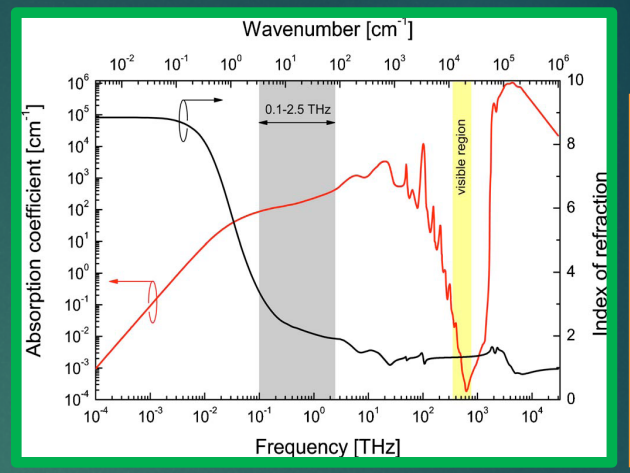
However, only in the late 80's and early 90's of the last century, this technology was started to be purposefully developed to solve the problems of rapidly developing optical methods of medical diagnostics and therapy (*Tuchin*, 2006; *Zhu et al.*, 2013; *Richardson et al.*, 2015; *Azaripour et al.*, 2016)

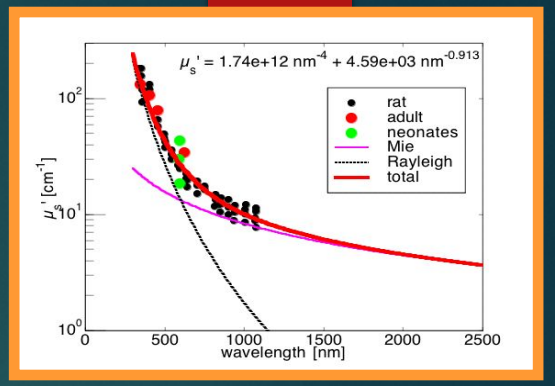
In the meantime, the OC technique has proved itself powerful in the UV, visible to NIR/FIR ranges (*Zhu et al.*, 2013, 2018; *Genina et al.*, 2015; *Richardson et al.*, 2015; *Azwendt et al.*, 2016; *Azaripour et al.*, 2016; *Oliveira et al.*, 2018; *Tainaka et al.* 2018; *Oliveira & Tuchin* 2019 ……..)

Immersion Optical Clearing Method









$$\mu_s' = \mu_s(1-g) \sim d^2\rho(d/\lambda)^{0.37}(m-1)^2$$

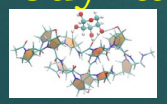
$$m \equiv n_s/n_0$$

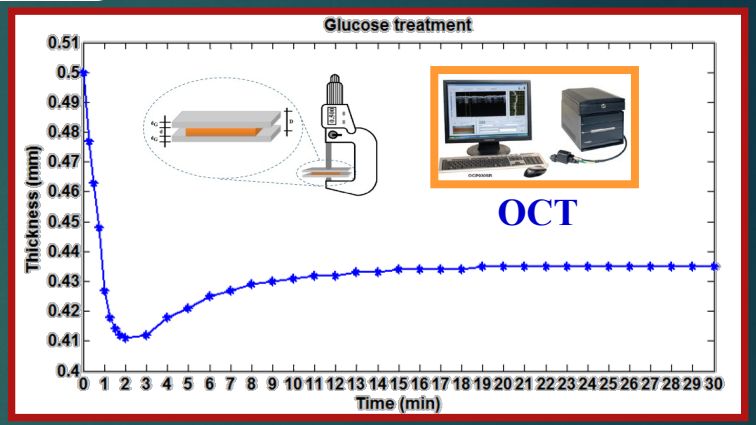
(1) Tissue/cell dehydration caused by osmotic action of an OCA
(2) OCA diffusion into the tissue/cell, replacement water by an OCA
Both mechanisms are important for THz spectroscopy/imaging
(1) and (2) are followed by:

- Tissue shrinkage: less thickness and better ordering of collagen fibers with volume fraction $f_c(t)$ caused by temporal/reversible dehydration

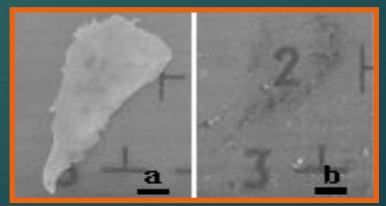
$$\mu_s' = \mu_s(1-g) \sim [1-f_c(t)]^3/[1+f_c(t)]$$

- Refractive index matching of tissue/cell components and ISF/cytoplasm
- Disruption of the collagen molecules hydration shell (alteration of the hydrodynamic radius) and its reversible dissociation

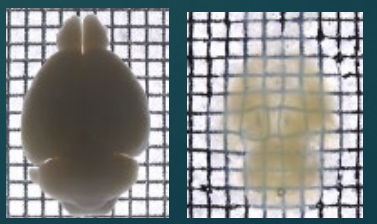




Human eye ball



Rabbit *dura mater*, 1-min in glycerol



Mouse whole brain

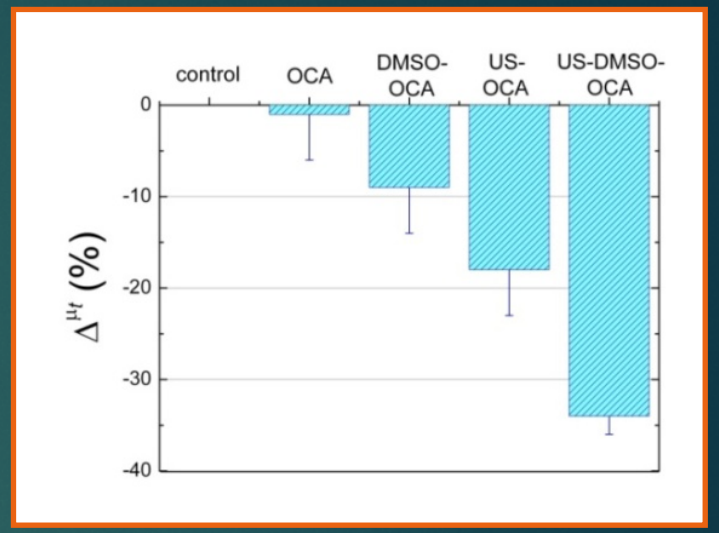
Hiroki R. Ueda et al. Chemical Landscape for Tissue Clearing Based on Hydrophilic Reagents, Cell Reports (2018)
More than 1,600 chemicals were screened by a high-throughput evaluation system for each chemical process.

In vitro measured optical clearing potential (OCP) at OCA application to dermis side of human skin using a Franz diffusion chamber

B. Choi et al. "Determination of chemical agent optical clearing potential using *in vitro* human skin," *Lasers Surg. Med.* 36, 72-75, 2005

Hydroxy-terminated chemical agent	Refractive index	Osmolality (mOsm/kg)	OCP
Glycerol	1.47	14,550	2.9±0.8
50% TMP (trimethylolpropanol)	1.43	6,830	2.2±0.3
100% TMP	1.47	13,660	2.1±0.7
1,3-butanediol	1.44	22,050	2.4±0.7
1,4-butanediol	1.44	26,900	2.8±0.5
Ethylene glycol	1.43	22,640	1.9±0.6
MPDiol glycol (1,3-diol, 2-methyl-propane)	1.44	23,460	2.3±0.2
P-0062[1]	1.48	1,643	2.0±0.5

[1] P-0062 is a polyethylene glycol based prepolymer (Univ. of California, Irvine)



Rat skin *in vivo*

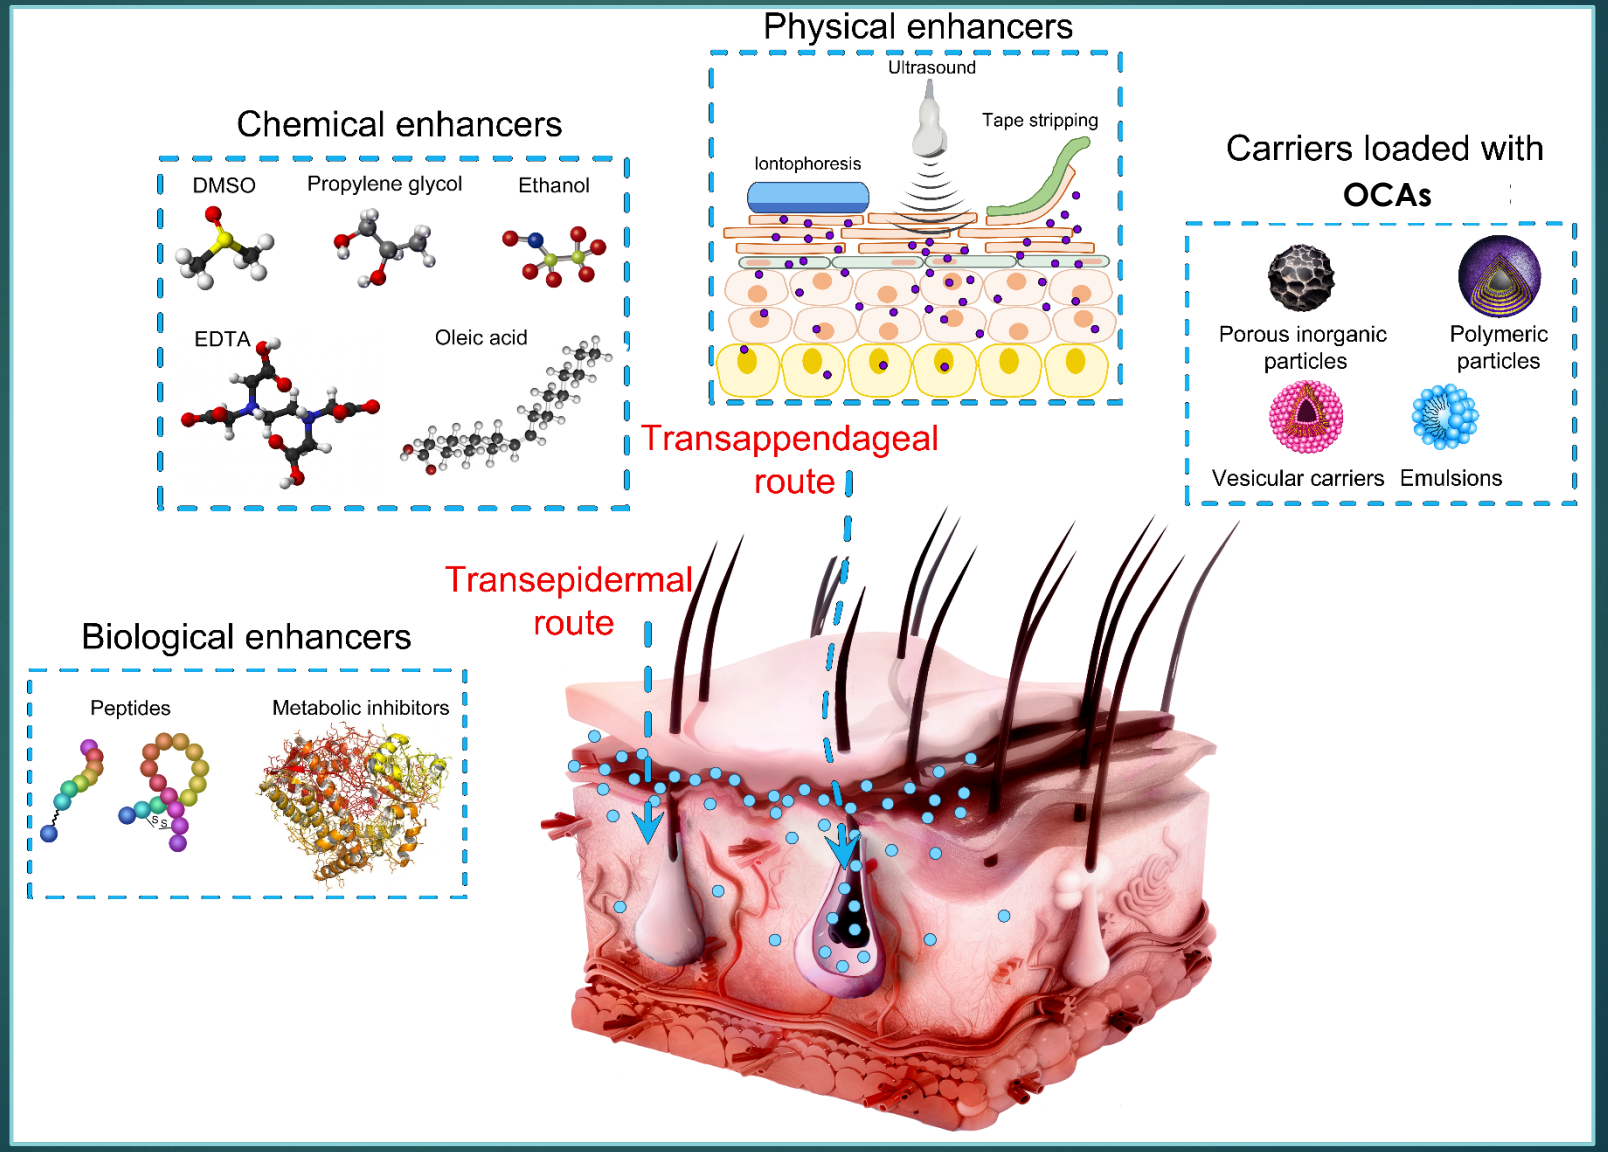
$$OCP \equiv \mu_s'(\text{before})/\mu_s'(\text{in 20 min after application})$$

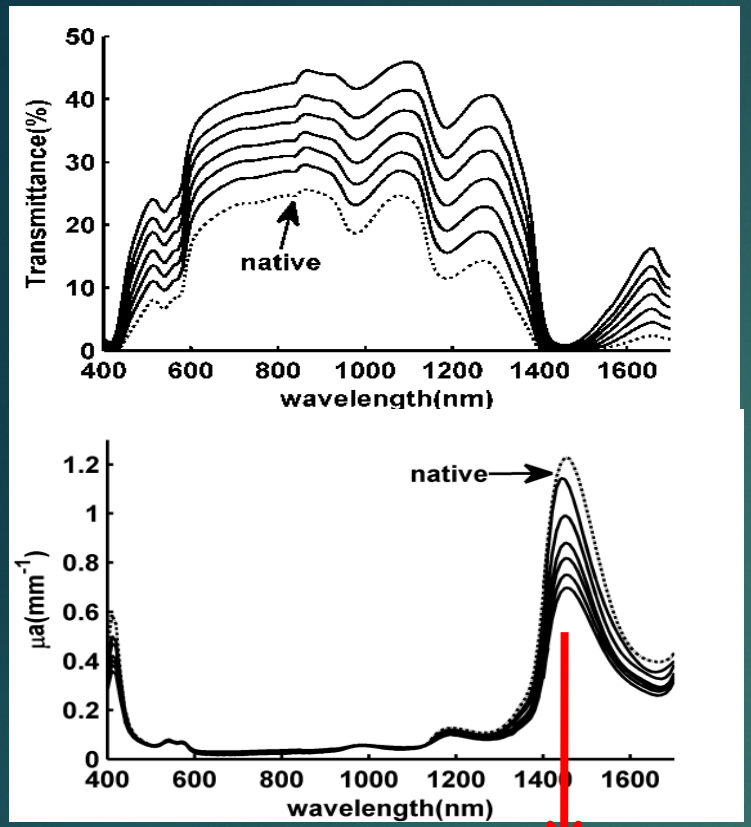
Saccharides: glucose, sucrose, maltose, fructose
PEGs, Propylene glycol (1,2-propanediol), DMSO, et. al

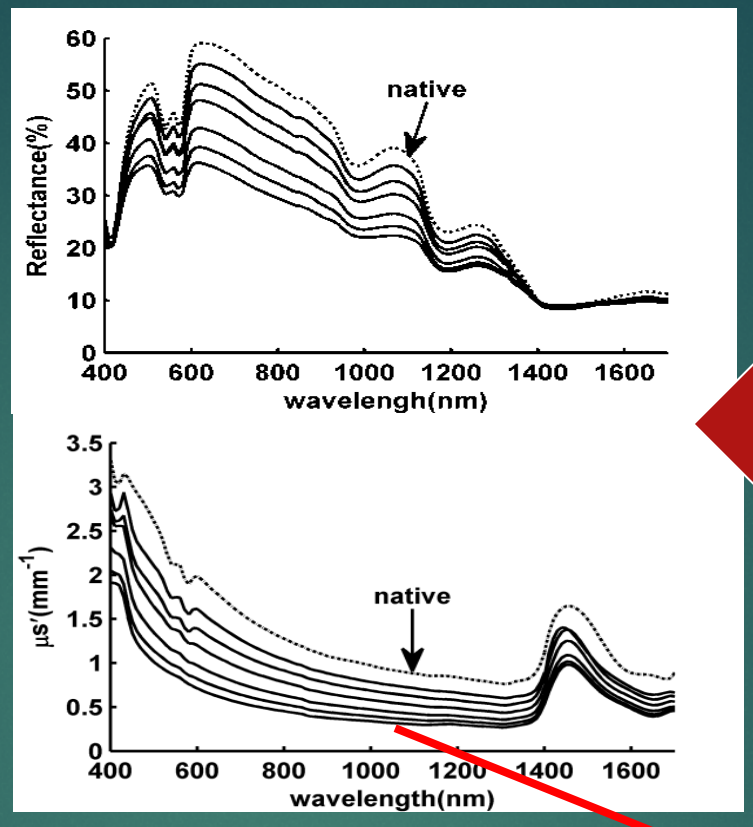
Iodine based non-ionic X-ray contrast media have lower osmolarity and tend to have less side-effects:
Omnipaque, Ultravist, Visipaque, etc.

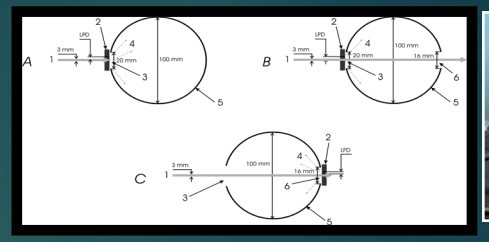
Enhancers for *in vivo* delivery of OCAs through biological membranes

E.V. Lengert, E. E. Talnikova, V. V. Tuchin, Yu. I. Svenskaya, Prospective strategies for enhanced intra- and transdermal delivery of antifungal drugs, *Skin Pharmacology and Physiology* **33**, 261–269 (2020)



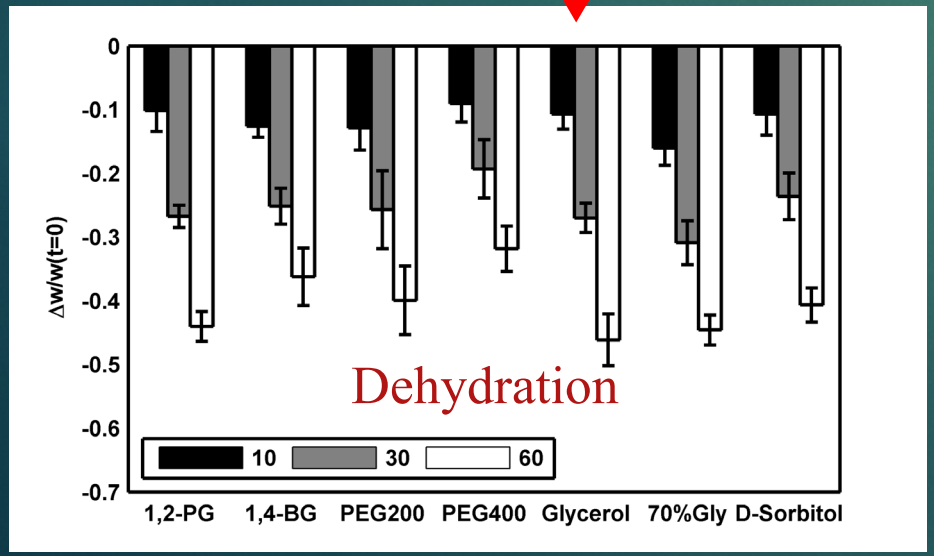


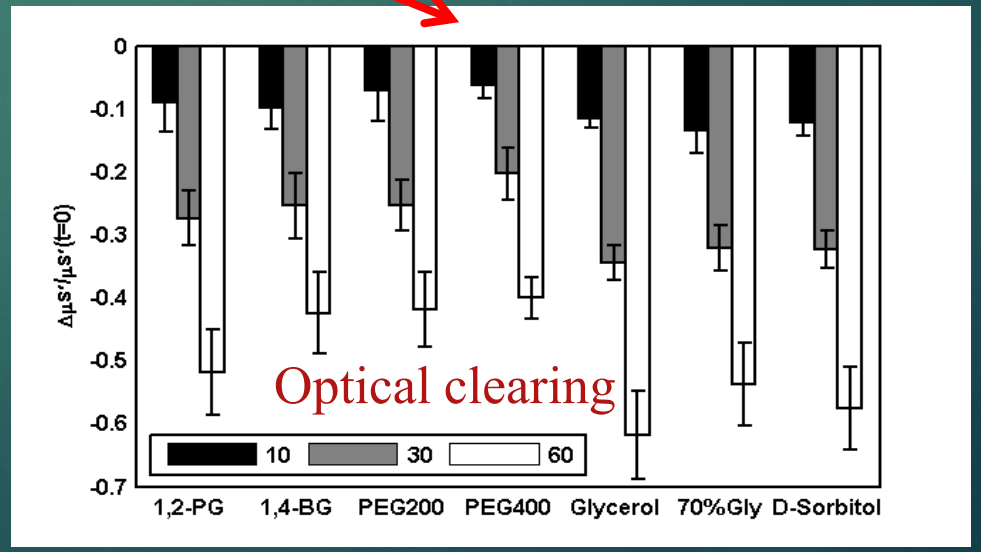




T. Yu, X. Wen, V.V .Tuchin, Q. Luo, D. Zhu, *J. Biomed. Opt.* 16 (2011)

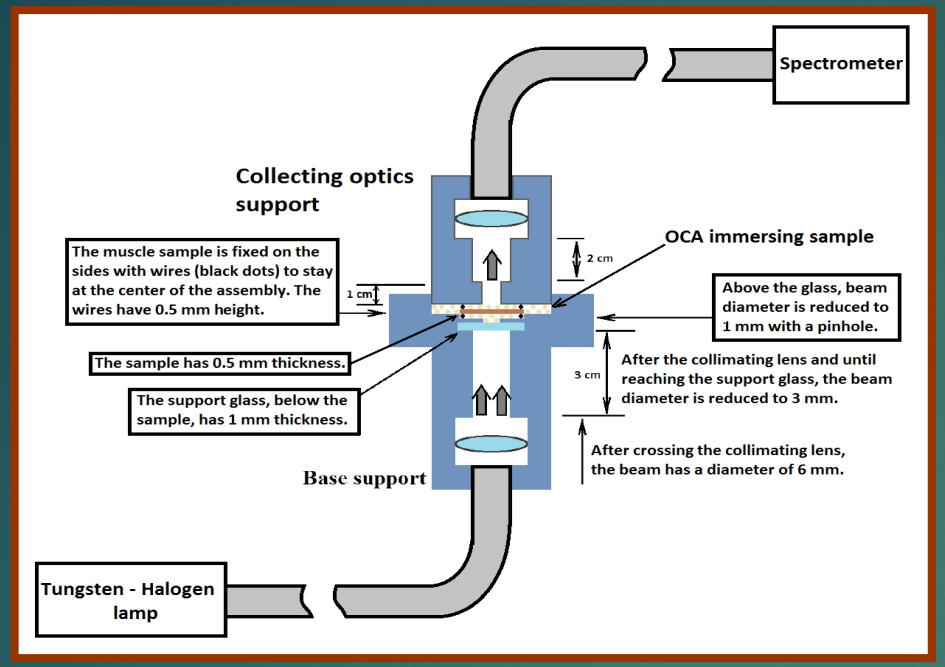
Pig skin sample before and after treatment
by 1,2-propanediol
at time intervals of
0 (native), 10, 20, 30, 40, 50 and 60 min

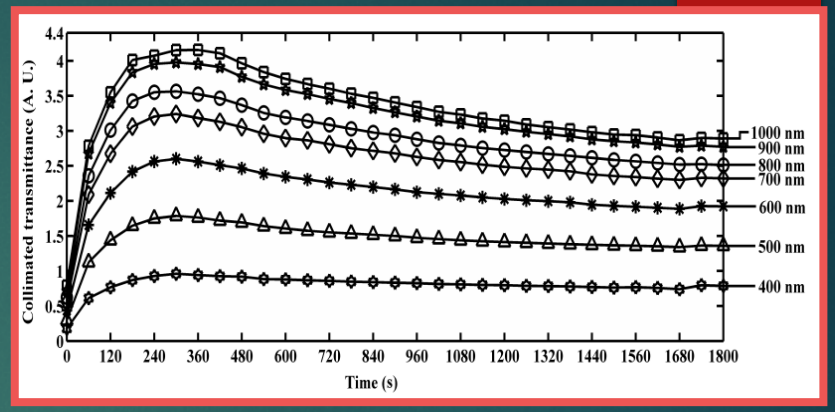




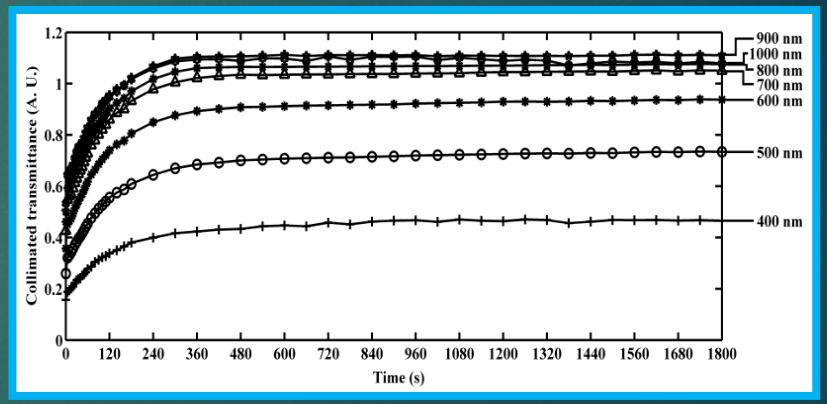
Time dependence for collimated transmittance for the rat muscle treatment with glucose

(L.Oliveira, M.I. Carvalho, E. Nogueira, V. V. Tuchin *JIOHS*, Vol. 6, No. 2, 1350012, 2013; JBO, 2015)

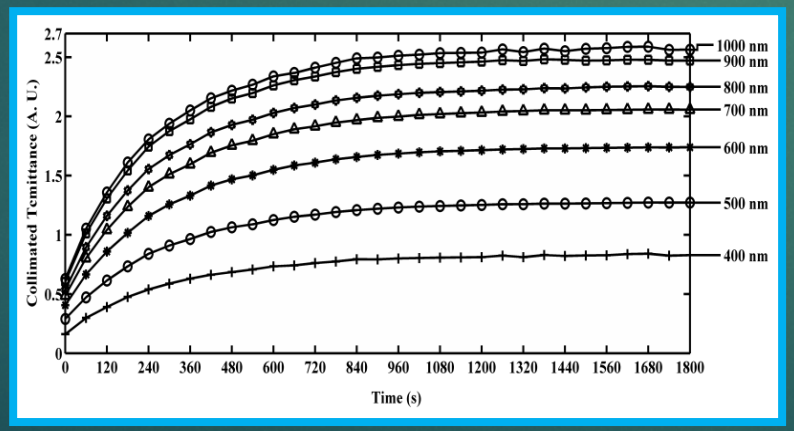




Glucose 20%



Glucose 50%



Glucose 40%

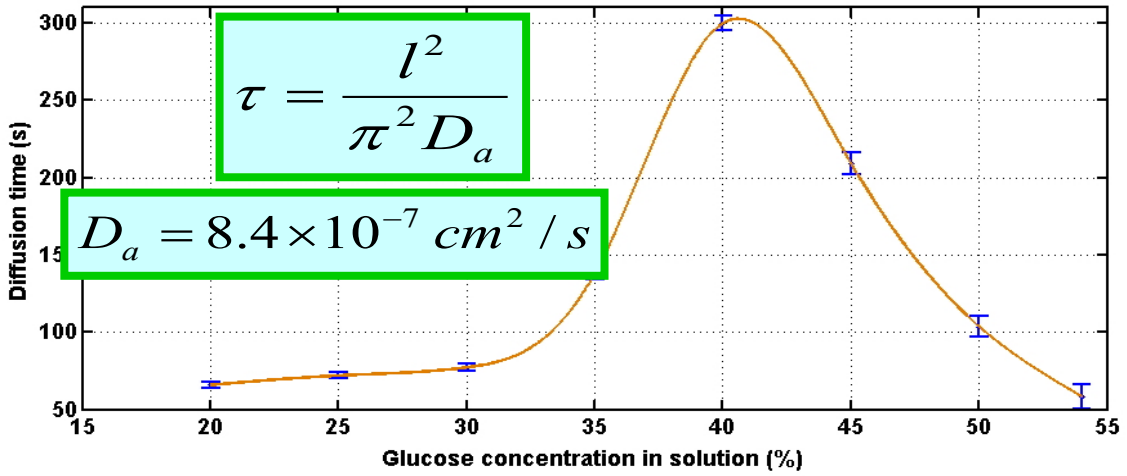
$$T_c(\lambda) \propto 1 - \exp\left(-\frac{t}{\tau}\right)$$

Diffusion time of Glucose and Ethylene Glycol in rat muscle

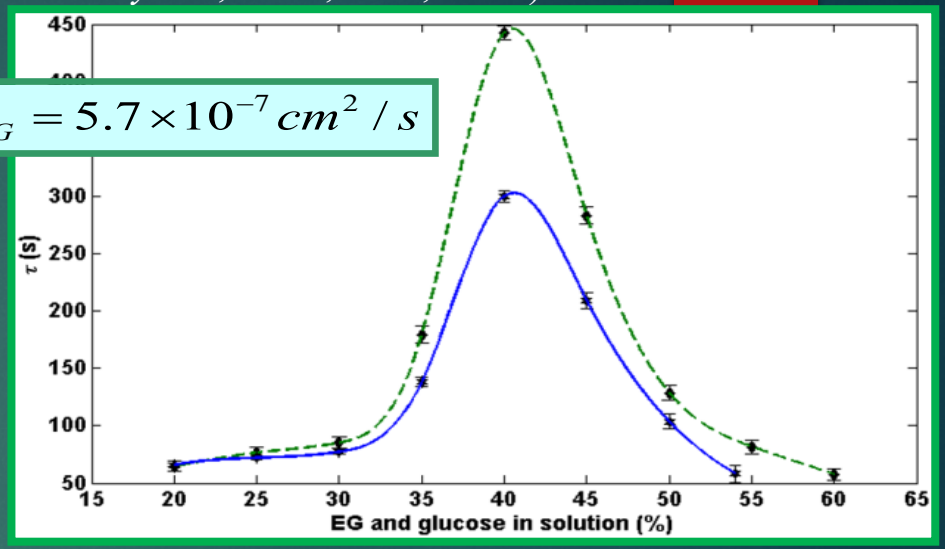
(L.Oliveira, M.I. Carvalho, E. Nogueira, V. V. Tuchin, *Laser Physics*, 2013, JBO, 2015)

$$\tau = \frac{l^2}{\pi^2 D_a}$$

$$D_a = 8.4 \times 10^{-7}\ cm^2 / s$$

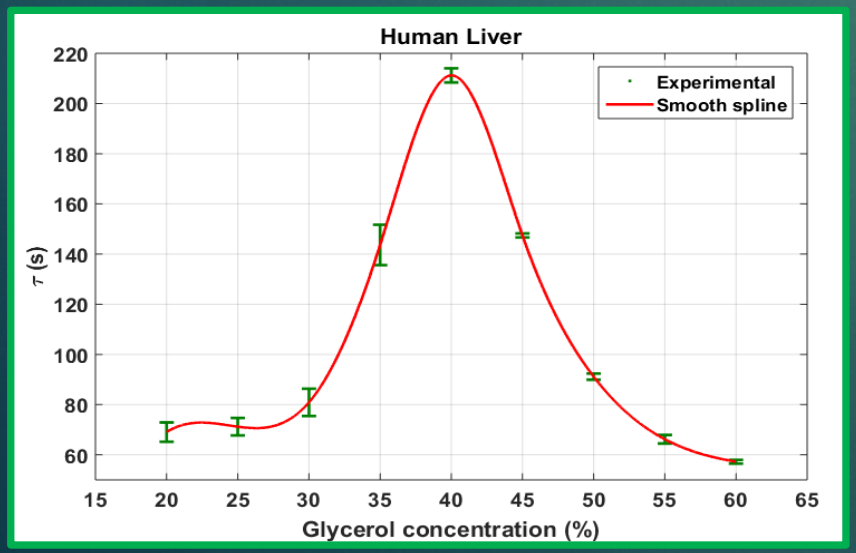


$$D_{EG} = 5.7 \times 10^{-7}\ cm^2 / s$$



$$f_{water\ \ natural} = f_{bound\ \ water} + f_{free\ \ water} = 0.161 + 0.595 = 0.756$$

$$f_{solid\ part} = 0.244$$



Evaluation of Water Content in **Human Liver**

I. Carneiro , S. Carvalho , R. Henrique , L. Oliveira , V. V. Tuchin, Simple multimodal optical technique for evaluation of free/bound water and dispersion of human liver tissue *J. Biomed. Opt.* 22(12), 125002 (2017)

Skin	$(1.68\pm0.88)\times10^{-5}$	$(1.00\pm0.57)\times10^{-5}$
Myocardium	$(11.8\pm6.1)\times10^{-5}$	$(1.04\pm0.65)\times10^{-5}$

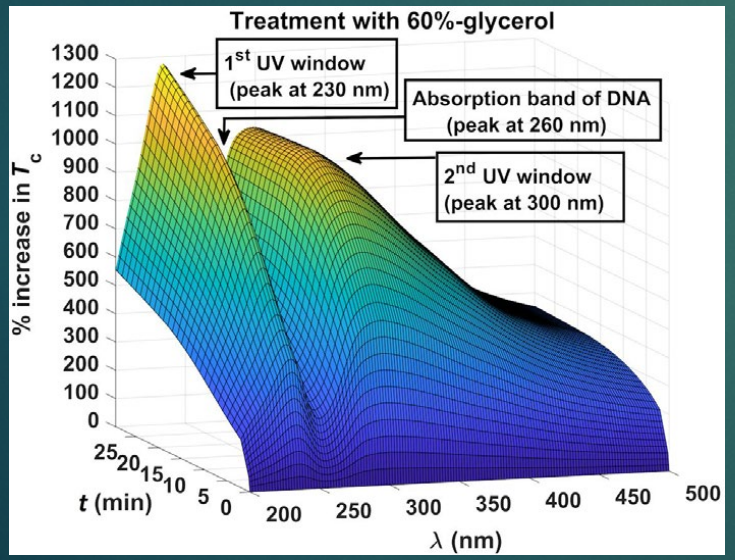
	Control group	Diabetic group
Optical clearing degree (A×100%)	46±19	37±16
Characteristic time of optical clearing, min (τ)	2.7±0.4	8.9±7.7

Creation of UV window

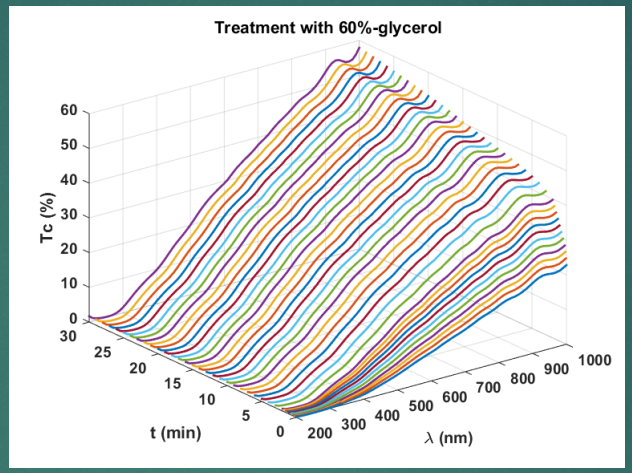
I. Carneiro, S. Carvalho, R. Henrique, L. M. Oliveira, V. V. Tuchin, Moving tissue spectral window to the deep-ultraviolet via optical clearing, *J. Biophotonics*. **12** (12), e201900181 (2019).

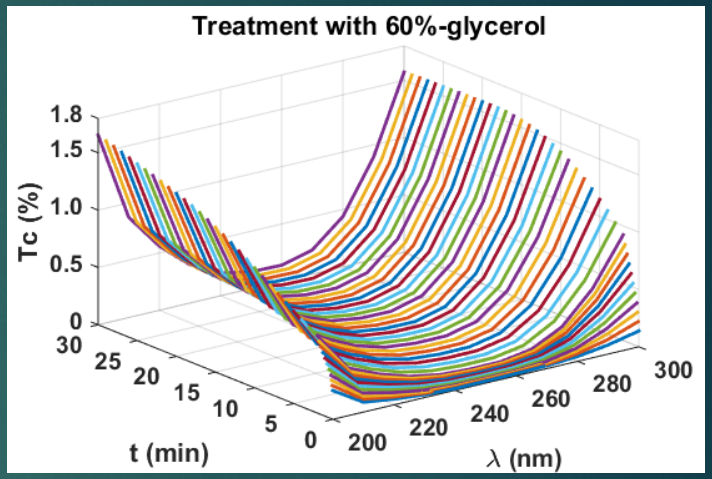
The sample was immersed in the **glycerol** solution and measurements (200-1000 nm) were aquired during 30 min treatment with a 5 s - time resolution

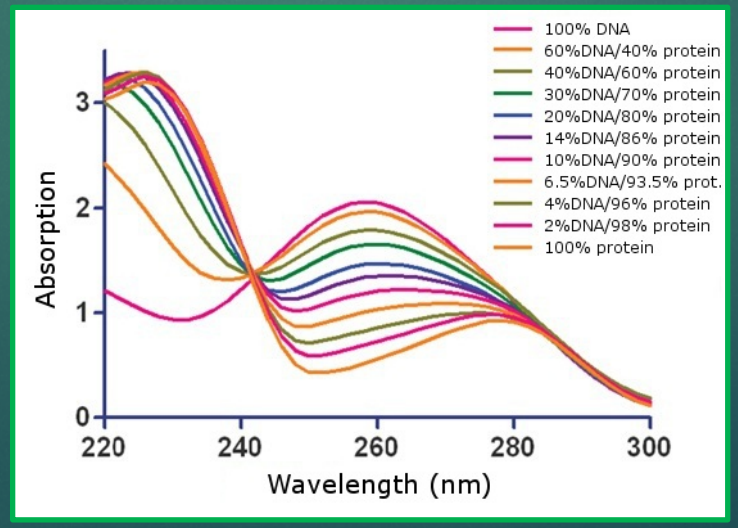
Surgical colorectal specimen



$$\%\ \boldsymbol{increase\ in}\ T_c = \frac{T_c(\lambda,t) - T_c(\lambda,t=0)}{T_c(\lambda,t=0)} \times 100\%$$





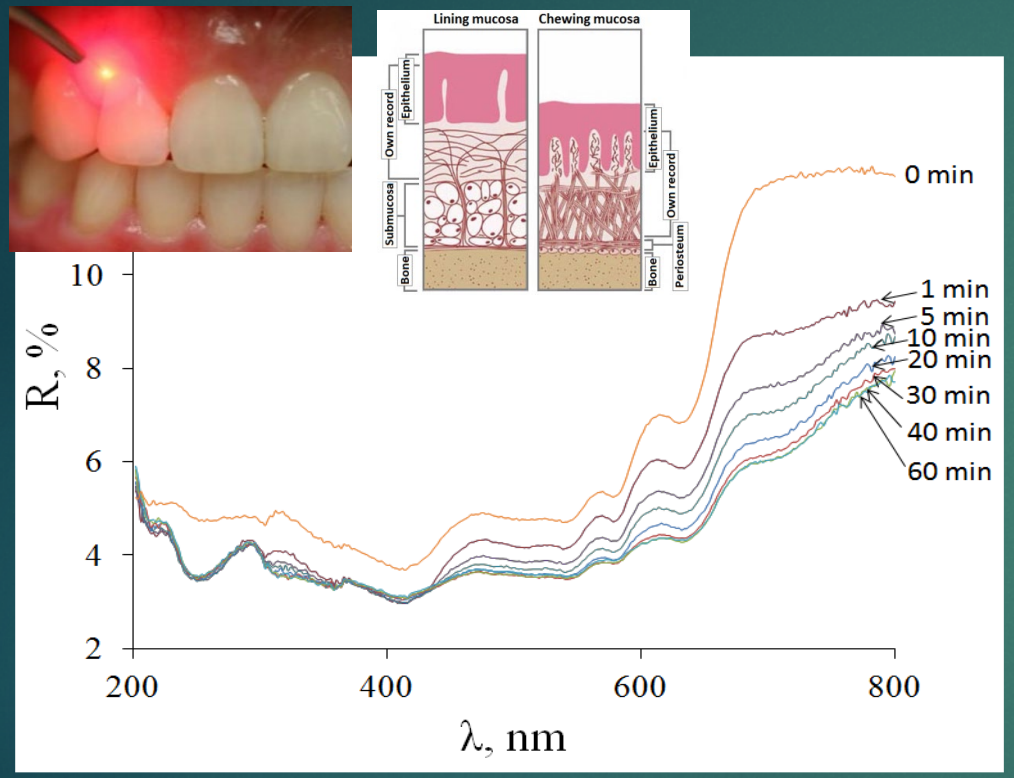


Similar behavior is observed on both sides of the DNA/Protein absorption band

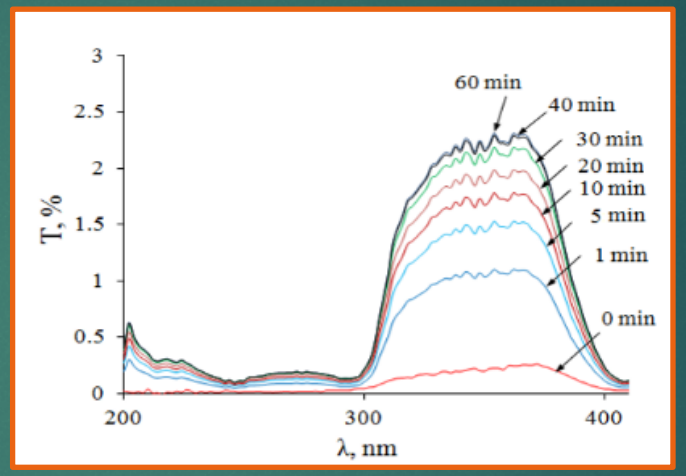
The OC effect in UV improves with the increase of glycerol concentration in the solution

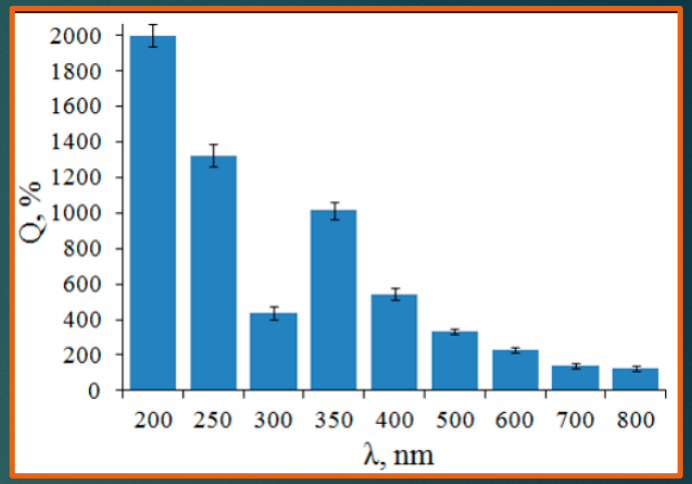
The effectiveness of human gum optical clearing

A. A. Selifonov , V. V. Tuchin, Kinetics of optical properties on selected laser lines of human periodontal gingiva when exposed to glycerol-propylene glycol mixture , FLAMN, St. Petersburg, July 2019.



OCA: 99.7% glycerol





The effectiveness of human gum OC in propylene glycol / glycerol / water mixture

E-cigarette vapor liquid

The effective diffusion coefficient of mixtures in human gum mucous tissue measured *in vitro* :

D **(30/70/0) = (2.3±0.4) ·10^{-6} cm^2/s**

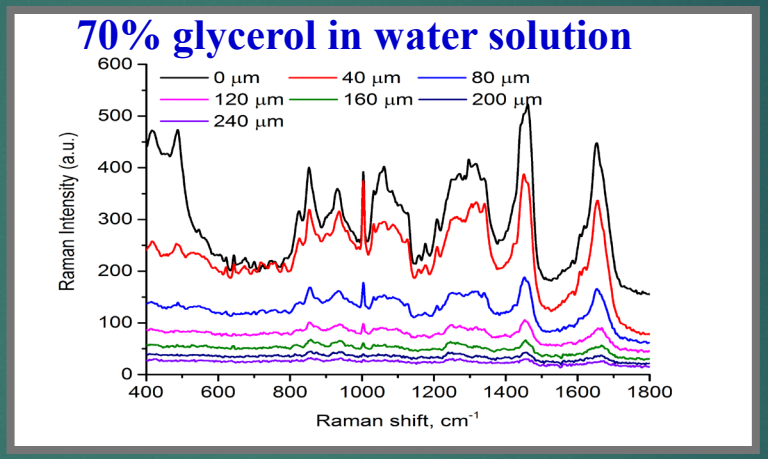
D **(50/50/0) = (2.6±0.6) ·10^{-6} cm^2/s**

D **(55/35/10) = (3.2±0.8) ·10^{-6} cm^2/s**

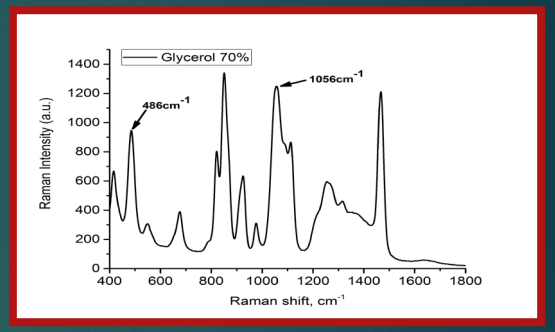
Fingerprint Raman spectra of porcine ear skin at OC

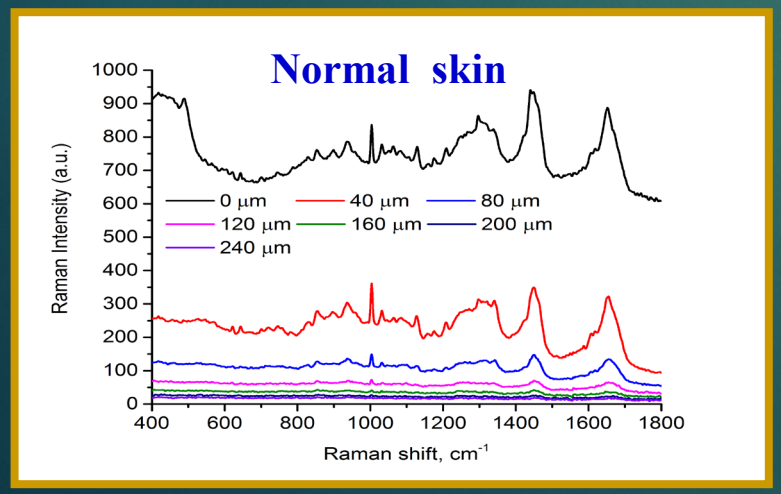
A. Yu. Sdobnov et. al. J. Physics D: Appl. Phys. 50, 285401(2017)

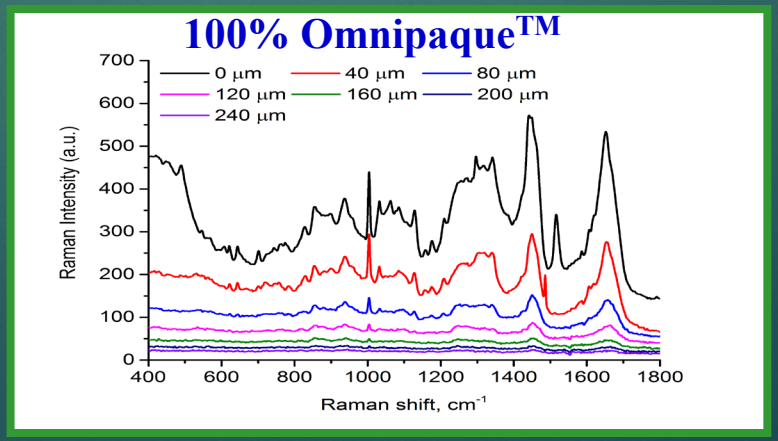
Confocal Raman Microscope (CRM) for *in vivo/ex vivo* skin measurements
River Diagnostics, Model 3510 SCA, Rotterdam, The Netherlands: 785 nm, oil objective ×50, laser power 20 mW, exposure 5 s, resolutions ≤ 5 μm and 2 cm^{-1}



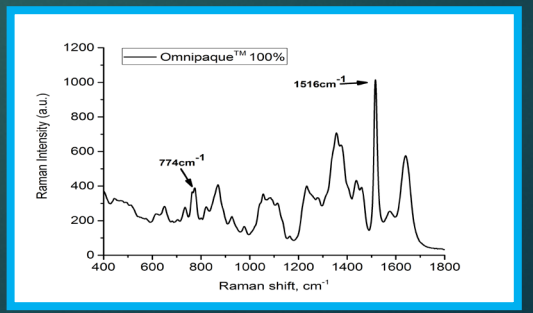
Glycerol



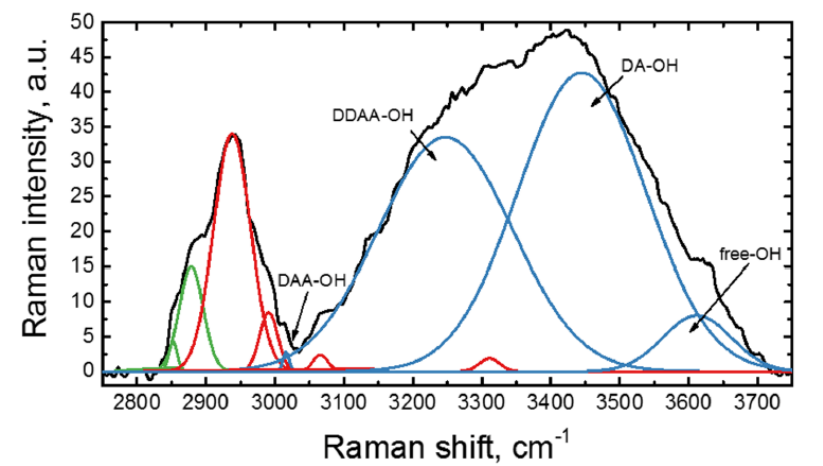


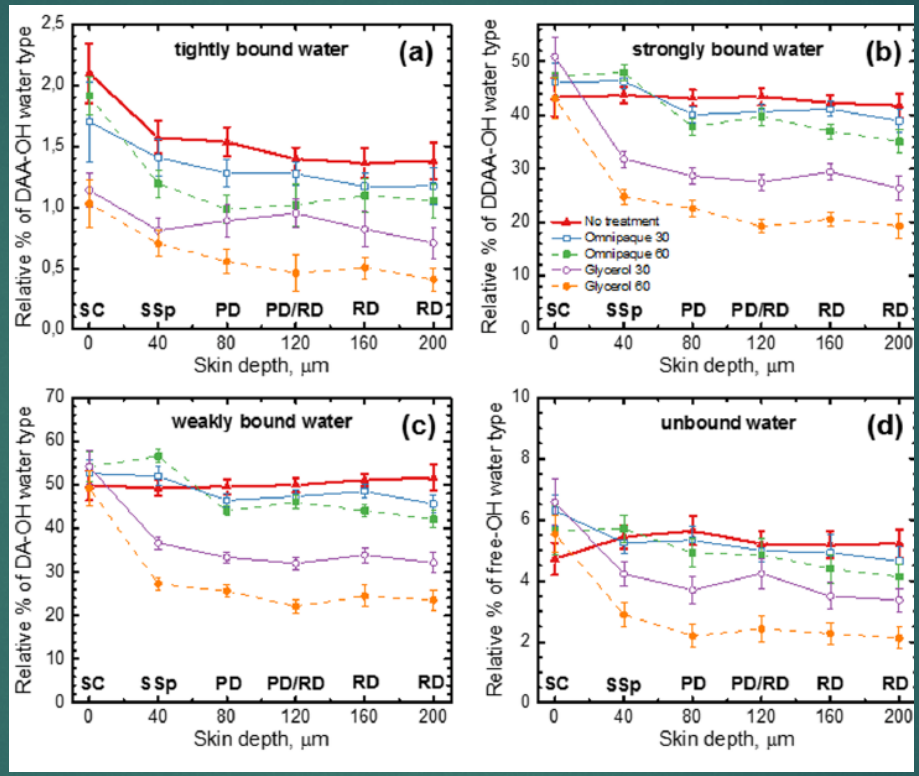


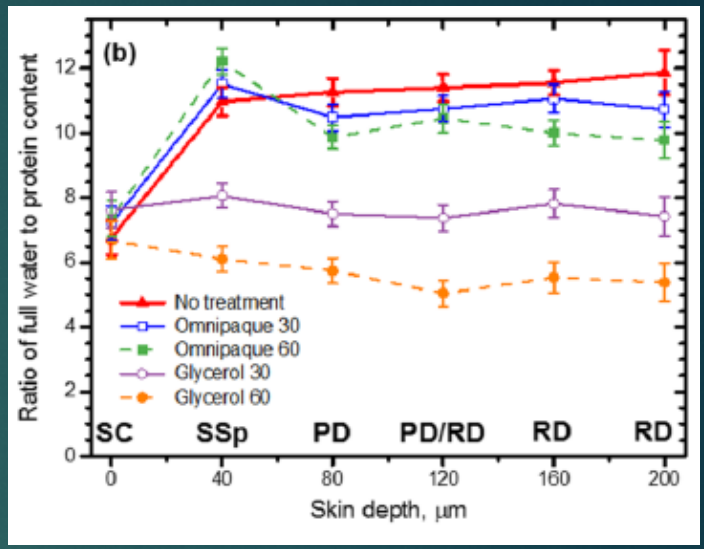
Omnipaque™



A. Sdobnov et al., Hydrogen bound water profiles in the skin influenced by optical clearing molecular agents- quantitative analysis using confocal Raman microscopy, *J. Biophotonics* 12 (5), e201800283 (2019)







Total water content (the ratio of full water to content of proteins).

The depth distribution of the relative percentage of DAA–OH (a), DDAA–OH (b), DA–OH (c) and free–OH (d) water types in the untreated skin (thick red line) and in the skin treated with Omnipaque for 30 min / 60 min and in the skin treated with glycerol for 30 min / 60 min)

SC – stratum corneum; SSp – stratum spinosum; PD – papillary dermis; RD – reticular dermis.

Kinetics of OC of human skin studied *in vivo* using a fiber Raman probe

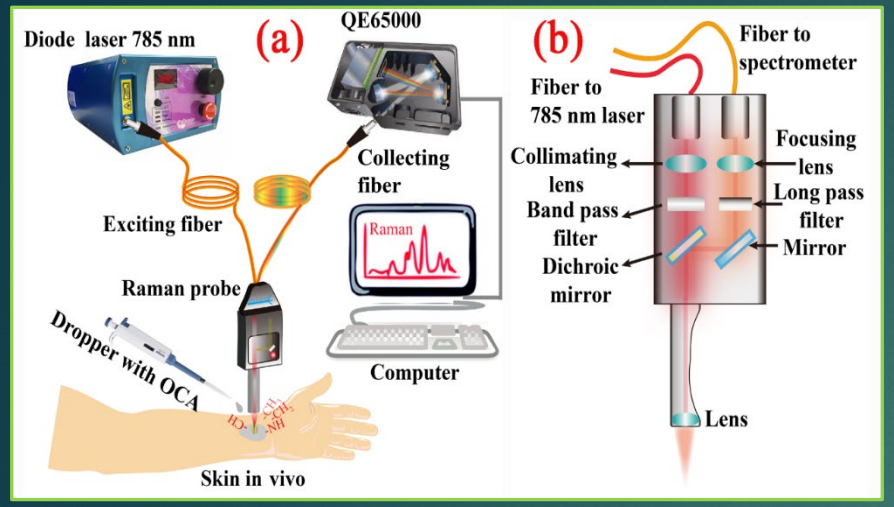


Diagram of the Raman experimental device (a) and detail of Raman probe (b)

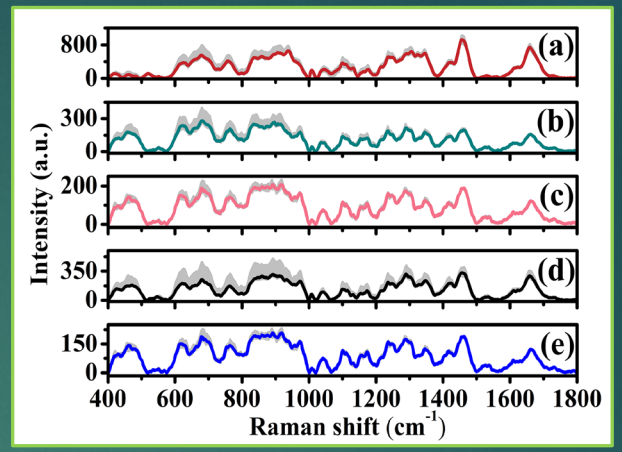
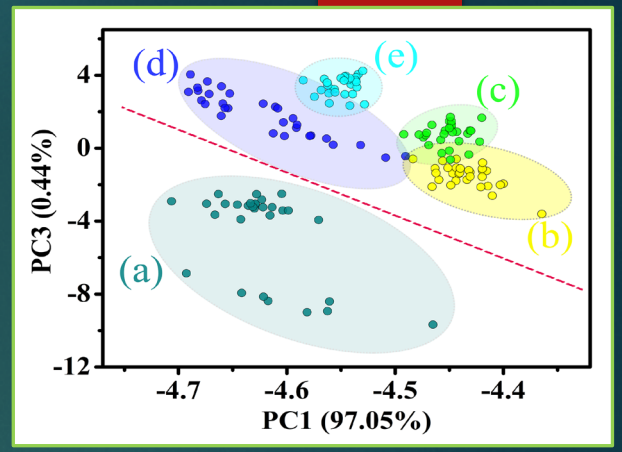
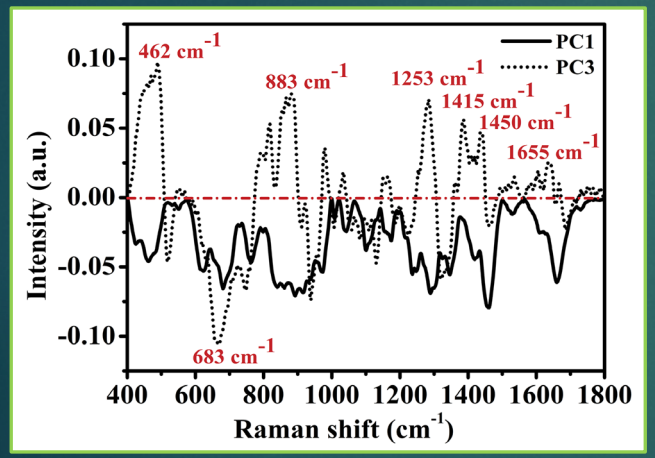
Q. Lin et al., *Laser Phys. Lett.* (2020)





In vivo Raman spectra and PC scores scatter plots for the Raman spectra acquired from different body sites: : fingernail (a), finger (b), arm (c), palm (d), and wrist (e)

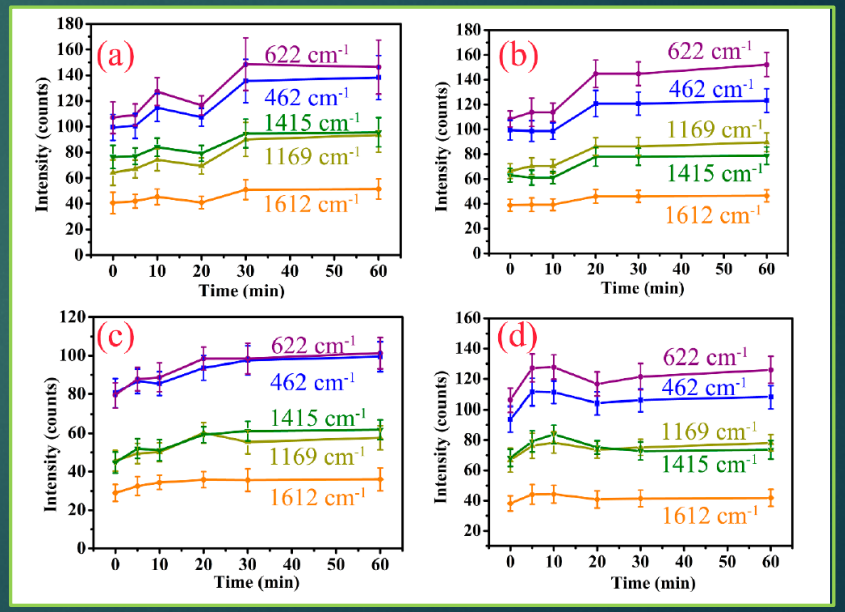


PC loading plots of the 1st (solid-line) and 3rd PCs (dotted-line) for the Raman spectra of different body sites

Raman spectra contribute differently to the classification

The PC variations of the different skin sites were largely dominated by bands at:

- **462 cm^{-1} (δ(CCC), proteins)**
- 683 cm^{-1} (ν(CS), amino acid)
- 883 cm^{-1} (ρ(CH$_2$)/ν(CC)/ν(CN), collagen)
- 1253 cm^{-1} (δ(CH$_2$)/ν(CN), nucleus)
- **1415 cm^{-1} (δ(CH$_3$), lipids)**
- 1450 cm^{-1} (δ(CH$_2$)/δ(CH$_3$); keratin, collagen)
- 1655 cm^{-1} (ν(C=O), keratin)



The time dependencies of wrist skin Raman peaks after application of glycerol with different concentration: 30% (a), 50% (b), 70% (c), and 99.9% (d).

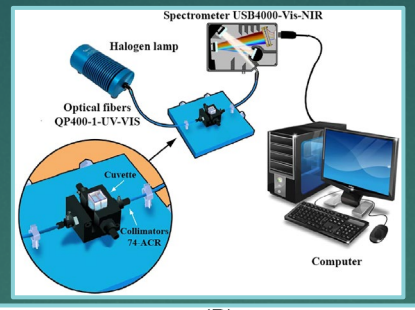
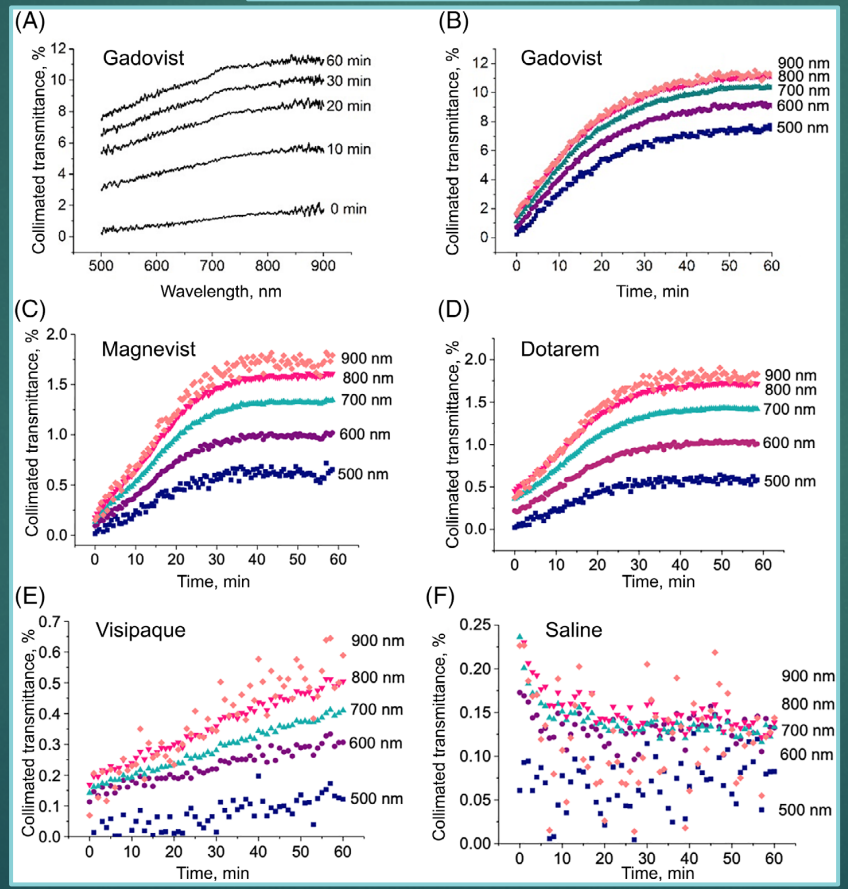
Administration of MRI agents

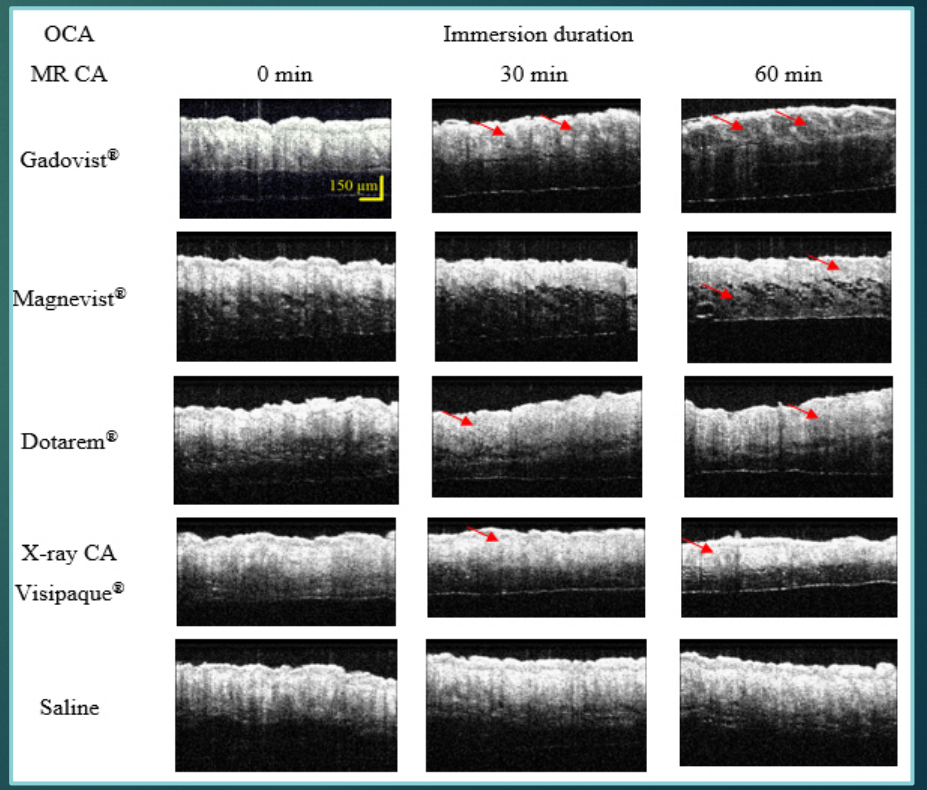




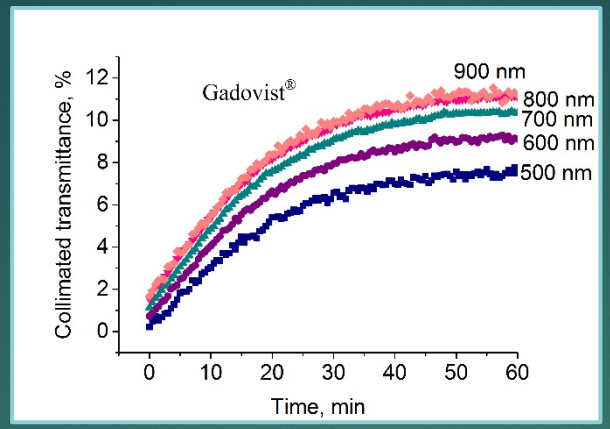
Collimated transmittance

- MRI contrasts can be successfully used as optical clearing agents for enhancing optical imaging
- This application clears the path for a fundamentally new approach in multimodal imaging, since synchronization in time and space occurs for enhancement of optical, CT and MRI image contrasts

OCT measurements of albino mouse skin *ex vivo*



Multi-wavelength measurements RI of MRI agents



$$T_c(\lambda) \propto 1 - \exp\left(-\frac{t}{\tau}\right)$$

$$\tau = \frac{L^2}{\pi^2 D_a}$$

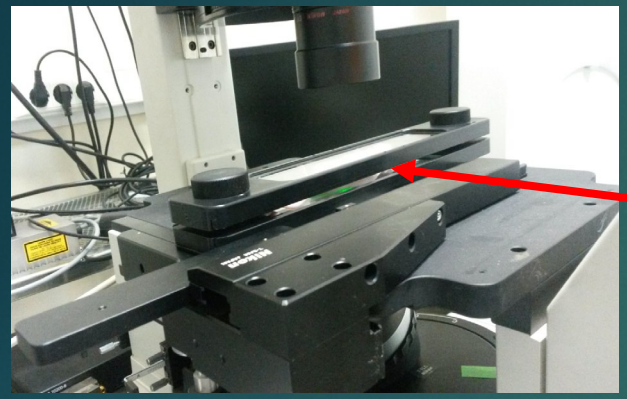
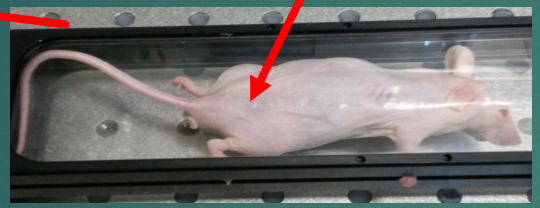
20 days after tumor cell enucleation (HEp2-TagRFP line) in BALBc/nude mice

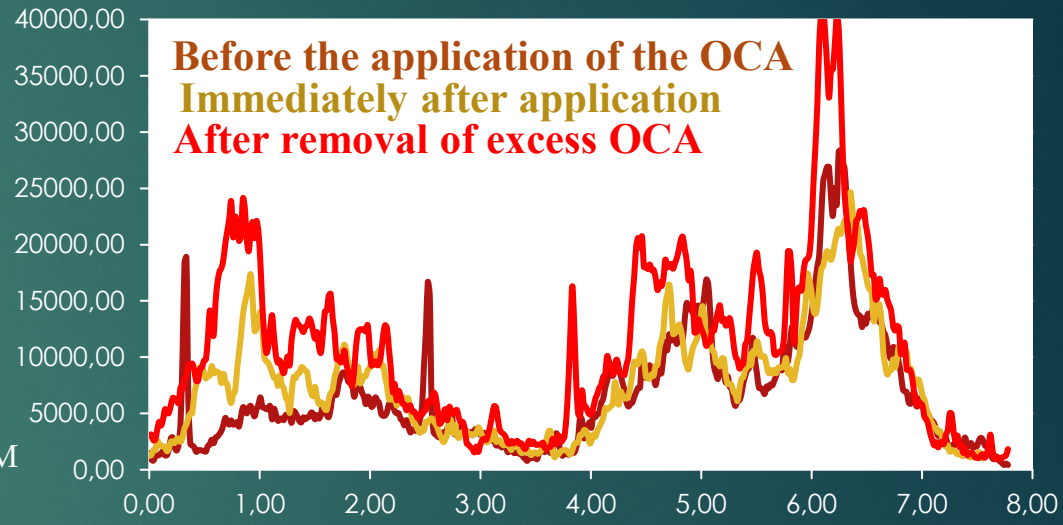
OCA: 70% glycerol, 5% DMSO, 25% water





Cassette with animal

Profiles for fluorescence signal



Instrumentation and Protocol

- DCS-120 confocal scanning system (Becker & Hickl GmbH)
- WhiteLase SC480-10 supercontinuum laser with acousto-optic tunable filter AOTF-V1-D-FDS-SM (FIANIUM)
- HPM-100-40 hybrid detector (Becker & Hickl GmbH)
- Fluorescence excitation wavelength was 540 nm
- Fluorescence emission from a tumor was collected through the skin in the epi-illumination configuration
- Long- and bandpass filters were used (HQ550LP and 580BP)
- SPCImage 3.2 data analysis software (Becker & Hickl GmbH).
- NIH ImageJ 1.48v software
- Animals were anesthetized by Zoletil-Rometar mixture and were put in a cassette on a mobile stage
- Optical clearing was performed for 15 min using a 70% glycerol, 5% DMSO, 25% water solution
- Image collection time for anesthetized mouse varied from 3.5 to 8 min depending of fluorophore expression level

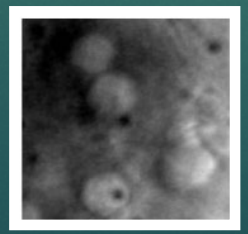
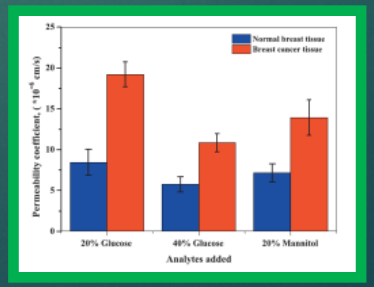
Cell imaging in lymph nodes

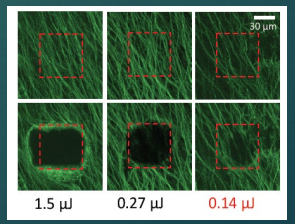


Cancerous tissue differentiation

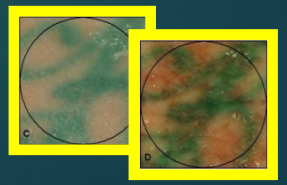


Precise laser surgery

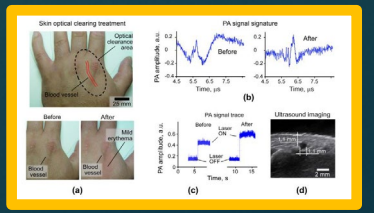
Scarred vocal fold



Laser tattoo removal



PA microscopy & flow cytometry



OC multimodality concept

Technique

- Integrating sphere spectroscopy
- Diffuse reflectance & fluoresc. spectrosc./imaging (DRFSI)
- Optical Coherence Tomography (OCT)
- Confocal Microscopy (CM)
- Raman spectrosc./imaging
- Photoacoustics (PA)
- Multiphoton microscopy (MPM)
- THz Spectrosc./Imaging
- X-ray computer tomography (CT)
- MRI

Experimental validation

- Multilayered, multimodal optical tissue phantoms
- *Ex vivo* & *in vivo studies*
- Healthy & pathological tissues
- Animal & human tissues

Optical Clearing

- Multicomponent biocompatible optical clearing agents (OCAs) for effective tissue optical clearing (OC) and enhancement of tissue image contrast
- Multimodal OCAs for OC and contrasting of CT and MRI

Data processing

- Inverse problem solution: tissue absorption, scattering & fluorescence properties
- Mathematical models
- Image processing (DRFSI OCT, CM, PA, Raman, MPM, THz)
- Multidimensional data classification including feature extraction/selection

❖ Improve and provide

- ➢ quantitative estimation of the concentration of chromophores and fluorophores of tissue at various depths
- ➢ multi-category classification of tissue properties based on the extraction of meaningful multimodal spectroscopic biomarkers
- ➢ clinically compatible spectroscopy-based methods of tissue pathology diagnosis
- ➢ practical recommendations for increasing *in vivo* efficacy of diagnostics in UV/visible/NIR (200-2000 nm), THz combined with x-ray CT and MRI

Conclusion

- Optical clearing agents are beneficial for enhanced multimodal spectroscopy/imaging: combination of optical techniques (Raman, OCT, FLIM, MPM, SHG, PA, Diffuse, THz) with X-ray CT and MRI
